

Programming Languages and Compilers (CS 421)

Elsa L Gunter
2112 SC, UIUC

<http://www.cs.uiuc.edu/class/cs421/>

Based in part on slides by Mattox Beckman, as updated by Vikram Adve and Gul Agha

9/8/11

1

Continuations

- A programming technique for all forms of “non-local” control flow:
 - non-local jumps
 - exceptions
 - general conversion of non-tail calls to tail calls
- Essentially it’s a higher-order function version of GOTO

9/8/11

2

Continuations

- Idea: Use functions to represent the control flow of a program
- Method: Each procedure takes a function as an extra argument to which to pass its result; outer procedure “returns” no result
- Function receiving the result called a continuation
- Continuation acts as “accumulator” for work still to be done

9/8/11

3

Example of Tail Recursion

```
# let rec app fl x =  
  match fl with [] -> x  
  | (f :: rem_fs) -> f (app rem_fs x);;  
val app : ('a -> 'a) list -> 'a -> 'a = <fun>  
# let app fs x =  
  let rec app_aux fl acc=  
    match fl with [] -> acc  
    | (f :: rem_fs) -> app_aux rem_fs  
                      (fun z -> acc (f z))  
  in app_aux fs (fun y -> y) x;;  
val app : ('a -> 'a) list -> 'a -> 'a = <fun>
```

9/8/11

4

Continuation Passing Style

- Writing procedures such that all procedure calls take a continuation to which to give (pass) the result, and return no result, is called continuation passing style (CPS)

9/8/11

5

Example of Tail Recursion & CSP

```
# let app fs x =  
  let rec app_aux fl acc=  
    match fl with [] -> acc  
    | (f :: rem_fs) -> app_aux rem_fs  
                      (fun z -> acc (f z))  
  in app_aux fs (fun y -> y) x;;  
val app : ('a -> 'a) list -> 'a -> 'a = <fun>  
# let rec appk fl x k =  
  match fl with [] -> k x  
  | (f :: rem_fs) -> appk rem_fs x (fun z -> k (f z));;  
val appk : ('a -> 'a) list -> 'a -> ('a -> 'b) -> 'b
```

9/8/11

6

Continuation Passing Style

- A compilation technique to implement non-local control flow, especially useful in interpreters.
- A formalization of non-local control flow in denotational semantics
- Possible intermediate state in compiling functional code

9/8/11

7

Why CPS?

- Makes order of evaluation explicitly clear
- Allocates variables (to become registers) for each step of computation
- Essentially converts functional programs into imperative ones
 - Major step for compiling to assembly or byte code
- Tail recursion easily identified
- Strict forward recursion converted to tail recursion

9/8/11

8

Example

- Simple reporting continuation:

```
# let report x = (print_int x; print_newline( ) );  
val report : int -> unit = <fun>
```

- Simple function using a continuation:

```
# let addk a b k = k (a + b)  
val addk : int -> int -> (int -> 'a) -> 'a = <fun>  
# addk 22 20 report;;  
2  
- : unit = ()
```

9/8/11

9

Simple Functions Taking Continuations

- Given a primitive operation, can convert it to pass its result forward to a continuation

- Examples:

```
# let subk x y k = k(x - y);  
val timesk : int -> int -> (int -> 'a) -> 'a = <fun>  
# let eqk x y k = k(x = y);  
val eqk : 'a -> 'a -> (bool -> 'b) -> 'b = <fun>  
# let timesk x y k = k(x * y);  
val timesk : int -> int -> (int -> 'a) -> 'a = <fun>
```

9/8/11

10

Nesting Continuations

```
# let add_three x y z = x + y + z;;  
val add_three : int -> int -> int -> int = <fun>  
# let add_three x y z = let p = x + y in p + z;;  
val add_three : int -> int -> int -> int = <fun>  
# let add_three_k x y z k =  
  addk x y (fun p -> addk p z k);;  
val add_three_k : int -> int -> int -> (int -> 'a)  
-> 'a = <fun>
```

9/8/11

11

Recursive Functions

- Recall:

```
# let rec factorial n =  
  if n = 0 then 1 else n * factorial (n - 1);;  
val factorial : int -> int = <fun>  
# factorial 5;;  
- : int = 120
```

9/8/11

12

Recursive Functions

```
# let rec factorial n =
  let b = (n = 0) in (* First computation *)
  if b then 1 (* Returned value *)
  else let s = n - 1 in (* Second computation *)
        let r = factorial s in (* Third computation *)
        n * r in (* Returned value *) ;;
val factorial : int -> int = <fun>
# factorial 5;;
- : int = 120
```

9/8/11

13

Recursive Functions

```
# let rec factorialk n k =
  eqk n 0
  (fun b -> (* First computation *)
    if b then k 1 (* Passed value *)
    else subk n 1 (* Second computation *)
          (fun s -> factorialk s (* Third computation *)
            (fun r -> timesk n r k))) (* Passed value *)
val factorialk : int -> int = <fun>
# factorialk 5 report;;
120
- : unit = ()
```

9/8/11

14

Recursive Functions

- To make recursive call, must build intermediate continuation to
 - take recursive value: r
 - build it to final result: $n * r$
 - And pass it to final continuation:
 - $times\ n\ r\ k = k\ (n * r)$

9/8/11

15

CPS for length

```
# let rec lengthk list k = match list with [ ] -> k 0
  | x :: xs -> lengthk xs (fun r -> k (r + 1));;
val lengthk : 'a list -> (int -> 'b) -> 'b = <fun>
# let rec lengthk list k = match list with [ ] -> k 0
  | x :: xs -> lengthk xs (fun r -> addk r 1 k);;
val lengthk : 'a list -> (int -> 'b) -> 'b = <fun>
# lengthk [2;4;6;8] report;;
4
- : unit = ()
```

9/8/11

16

Terminology

- Tail Position: A subexpression s of expressions e , such that if evaluated, will be taken as the value of e
 - $\text{if } (x > 3) \text{ then } x + 2 \text{ else } x - 4$
 - $\text{let } x = 5 \text{ in } x + 4$
- Tail Call: A function call that occurs in tail position
 - $\text{if } (h\ x) \text{ then } f\ x \text{ else } (x \pm g\ x)$

9/8/11

17

Terminology

- Available: A function call that can be executed by the current expression
- The fastest way to be unavailable is to be guarded by an abstraction (anonymous function).
 - $\text{if } (h\ x) \text{ then } f\ x \text{ else } (x + g\ x)$
 - $\text{if } (h\ x) \text{ then } (\text{fun } x \rightarrow f\ x) \text{ else } (g\ (x + x))$

9/8/11

18

CPS Transformation

- Step 1: Add continuation argument to any function definition:
 - let $f \text{ arg} = e \Rightarrow \text{let } f \text{ arg } k = e$
 - Idea: Every function takes an extra parameter saying where the result goes
- Step 2: A simple expression in tail position should be passed to a continuation instead of returned:
 - return $a \Rightarrow k \ a$
 - Assuming a is a constant or variable.
 - "Simple" = "No available function calls."

9/8/11

19

CPS Transformation

- Step 3: Pass the current continuation to every function call in tail position
 - return $f \text{ arg} \Rightarrow f \text{ arg } k$
 - The function "isn't going to return," so we need to tell it where to put the result.

9/8/11

20

CPS Transformation

- Step 4: Each function call not in tail position needs to be built into a new continuation (containing the old continuation as appropriate)
 - return $op \ (f \text{ arg}) \Rightarrow f \text{ arg} \ (\text{fun } r \rightarrow k(op \ r))$
 - op represents a primitive operation
- return $f(g \text{ arg}) \Rightarrow g \text{ arg} \ (\text{fun } r \rightarrow f \ r \ k)$

9/8/11

21

Example

Before:

```
let rec add_list lst =
  match lst with
  | [] -> 0
  | 0 :: xs -> add_list xs
  | x :: xs -> (+) x
    (add_list xs);;
```

After:

```
let rec add_listk lst k =
  (* rule 1 *)
  match lst with
  | [] -> k 0 (* rule 2 *)
  | 0 :: xs -> add_listk xs k
    (* rule 3 *)
  | x :: xs -> add_listk xs
    (fun r -> k ((+) x r));;
  (* rule 4 *)
```

9/8/11

22

Other Uses for Continuations

- CPS designed to preserve order of evaluation
- Continuations used to express order of evaluation
- Can be used to change order of evaluation
- Implements:
 - Exceptions and exception handling
 - Co-routines
 - (pseudo) threads

9/8/11

23

Exceptions - Example

```
# exception Zero;;
exception Zero
# let rec list_mult_aux list =
  match list with [ ] -> 1
  | x :: xs ->
    if x = 0 then raise Zero
    else x * list_mult_aux xs;;
val list_mult_aux : int list -> int = <fun>
```

9/8/11

24

Exceptions - Example

```
# let list_mult list =  
  try list_mult_aux list with Zero -> 0;;  
val list_mult : int list -> int = <fun>  
# list_mult [3;4;2];;  
- : int = 24  
# list_mult [7;4;0];;  
- : int = 0  
# list_mult_aux [7;4;0];;  
Exception: Zero.
```

9/8/11

25

Exceptions

- When an exception is raised
 - The current computation is aborted
 - Control is “thrown” back up the call stack until a matching handler is found
 - All the intermediate calls waiting for a return value are thrown away

9/8/11

26

Implementing Exceptions

```
# let multkp m n k =  
  let r = m * n in  
  (print_string "product result: ";  
   print_int r; print_string "\n";  
   k r);;  
val multkp : int -> int -> (int -> 'a) -> 'a  
= <fun>
```

9/8/11

27

Implementing Exceptions

```
# let rec list_multk_aux list k kexcp =  
  match list with [ ] -> k 1  
  | x :: xs -> if x = 0 then kexcp 0  
               else list_multk_aux xs  
                  (fun r -> multkp x r k) kexcp;;  
val list_multk_aux : int list -> (int -> 'a) -> (int -> 'a)  
-> 'a = <fun>  
# let rec list_multk list k = list_multk_aux list k k;;  
val list_multk : int list -> (int -> 'a) -> 'a = <fun>
```

9/8/11

28

Implementing Exceptions

```
# list_multk [3;4;2] report;;  
product result: 2  
product result: 8  
product result: 24  
24  
- : unit = ()  
# list_multk [7;4;0] report;;  
0  
- : unit = ()
```
