

# Programming Languages and Compilers (CS 421)

Elsa L Gunter  
2112 SC, UIUC

<http://www.cs.illinois.edu/class/cs421/>

Based in part on slides by Mattox Beckman, as updated by Vikram Adve and Gul Agha

10/25/11

1

## LR Parsing

- Read tokens left to right (L)
- Create a rightmost derivation (R)
- How is this possible?
- Start at the bottom (left) and work your way up
- Last step has only one non-terminal to be replaced so is right-most
- Working backwards, replace mixed strings by non-terminals
- Always proceed so that there are no non-terminals to the right of the string to be replaced

10/25/11

2

Example:  $\langle \text{Sum} \rangle = 0 \mid 1 \mid (\langle \text{Sum} \rangle)$   
|  $\langle \text{Sum} \rangle + \langle \text{Sum} \rangle$

$\langle \text{Sum} \rangle \Rightarrow$

$= (0 + 1) + 0$       shift

10/25/11

3

Example:  $\langle \text{Sum} \rangle = 0 \mid 1 \mid (\langle \text{Sum} \rangle)$   
|  $\langle \text{Sum} \rangle + \langle \text{Sum} \rangle$

$\langle \text{Sum} \rangle \Rightarrow$

$= (0 + 1) + 0$       shift  
 $= (0 + 1) + 0$       shift

10/25/11

4

Example:  $\langle \text{Sum} \rangle = 0 \mid 1 \mid (\langle \text{Sum} \rangle)$   
|  $\langle \text{Sum} \rangle + \langle \text{Sum} \rangle$

$\langle \text{Sum} \rangle \Rightarrow$

$\Rightarrow (0 + 1) + 0$       reduce  
 $= (0 + 1) + 0$       shift  
 $= (0 + 1) + 0$       shift

10/25/11

5

Example:  $\langle \text{Sum} \rangle = 0 \mid 1 \mid (\langle \text{Sum} \rangle)$   
|  $\langle \text{Sum} \rangle + \langle \text{Sum} \rangle$

$\langle \text{Sum} \rangle \Rightarrow$

$= (\langle \text{Sum} \rangle + 1) + 0$       shift  
 $\Rightarrow (0 + 1) + 0$       reduce  
 $= (0 + 1) + 0$       shift  
 $= (0 + 1) + 0$       shift

10/25/11

6

Example

$$( 0 + 1 ) + 0$$

10/25/11

## Example

10/25/11

31

## LR Parsing Tables

- Build a pair of tables, Action and Goto, from the grammar
  - This is the hardest part, we omit here
  - Rows labeled by states
  - For Action, columns labeled by terminals and "end-of-tokens" marker
    - (more generally strings of terminals of fixed length)
  - For Goto, columns labeled by non-terminals

10/25/11

32

## Action and Goto Tables

- Given a state and the next input, Action table says either
  - **shift** and go to state  $n$ , or
  - **reduce** by production  $k$  (explained in a bit)
  - **accept** or **error**
- Given a state and a non-terminal, Goto table says
  - go to state  $m$

10/25/11

33

## LR(i) Parsing Algorithm

- Based on push-down automata
- Uses states and transitions (as recorded in Action and Goto tables)
- Uses a stack containing states, terminals and non-terminals

10/25/11

34

## LR(i) Parsing Algorithm

0. Insure token stream ends in special "end-of-tokens" symbol
1. Start in state 1 with an empty stack
2. Push **state**(1) onto stack
- 3. Look at next  $i$  tokens from token stream ( $toks$ ) (don't remove yet)
4. If top symbol on stack is **state**( $n$ ), look up action in Action table at  $(n, toks)$

10/25/11

35

## LR(i) Parsing Algorithm

5. If action = **shift**  $m$ ,
  - a) Remove the top token from token stream and push it onto the stack
  - b) Push **state**( $m$ ) onto stack
  - c) Go to step 3

10/25/11

36

## LR(i) Parsing Algorithm

6. If action = **reduce**  $k$  where production  $k$  is  $E ::= u$
- Remove  $2 * \text{length}(u)$  symbols from stack ( $u$  and all the interleaved states)
  - If new top symbol on stack is **state**( $m$ ), look up new state  $p$  in  $\text{Goto}(m,E)$
  - Push  $E$  onto the stack, then push **state**( $p$ ) onto the stack
  - Go to step 3

10/25/11

37

## LR(i) Parsing Algorithm

7. If action = **accept**
- Stop parsing, return success
8. If action = **error**,
- Stop parsing, return failure

10/25/11

38

## Adding Synthesized Attributes

- Add to each **reduce** a rule for calculating the new synthesized attribute from the component attributes
- Add to each non-terminal pushed onto the stack, the attribute calculated for it
- When performing a **reduce**,
  - gather the recorded attributes from each non-terminal popped from stack
  - Compute new attribute for non-terminal pushed onto stack

10/25/11

39

## Shift-Reduce Conflicts

- Problem:** can't decide whether the action for a state and input character should be **shift** or **reduce**
- Caused by ambiguity in grammar
- Usually caused by lack of associativity or precedence information in grammar

10/25/11

40

Example:  $\langle \text{Sum} \rangle = 0 \mid 1 \mid (\langle \text{Sum} \rangle)$   
 $\mid \langle \text{Sum} \rangle + \langle \text{Sum} \rangle$

$\bullet 0 + 1 + 0$                       shift  
 $\rightarrow 0 \bullet + 1 + 0$                     reduce  
 $\rightarrow \langle \text{Sum} \rangle \bullet + 1 + 0$                 shift  
 $\rightarrow \langle \text{Sum} \rangle + \bullet 1 + 0$                 shift  
 $\rightarrow \langle \text{Sum} \rangle + 1 \bullet + 0$                 reduce  
 $\rightarrow \langle \text{Sum} \rangle + \langle \text{Sum} \rangle \bullet + 0$

10/25/11

41

## Example - cont

- Problem:** shift or reduce?
- You can shift-shift-reduce-reduce or reduce-shift-shift-reduce
- Shift first - right associative
- Reduce first- left associative

10/25/11

42

## Reduce - Reduce Conflicts

- **Problem:** can't decide between two different rules to reduce by
- Again caused by ambiguity in grammar
- **Symptom:** RHS of one production suffix of another
- Requires examining grammar and rewriting it
- Harder to solve than shift-reduce errors

10/25/11

43

## Example

■  $S ::= A \mid aB$      $A ::= abc$      $B ::= bc$

● abc            shift  
a ● bc           shift  
ab ● c           shift  
abc ●

- Problem: reduce by  $B ::= bc$  then by  $S ::= aB$ , or by  $A ::= abc$  then  $S::A$ ?

10/25/11

44

## Using Ocamlyacc

- Input attribute grammar is put in file `<grammar>.mly`
- Execute  
`ocamlyacc <grammar>.mly`
- Produces code for parser in `<grammar>.ml`  
and interface (including type declaration for tokens) in `<grammar>.mli`

10/25/11

45

## Parser Code

- `<grammar>.ml` defines one parsing function per entry point
- Parsing function takes a lexing function (lexer buffer to token) and a lexer buffer as arguments
- Returns semantic attribute of corresponding entry point

10/25/11

46

## Ocamlyacc Input

- File format:

```
%{  
  <header>  
}%  
  <declarations>  
%%  
  <rules>  
%%  
  <trailer>
```

10/25/11

47

## Ocamlyacc <header>

- Contains arbitrary Ocaml code
- Typically used to give types and functions needed for the semantic actions of rules and to give specialized error recovery
- May be omitted
- `<footer>` similar. Possibly used to call parser

10/25/11

48

## Ocamlyacc <declarations>

- **%token** *symbol ... symbol*
- Declare given symbols as tokens
- **%token** <type> *symbol ... symbol*
- Declare given symbols as token constructors, taking an argument of type <type>
- **%start** *symbol ... symbol*
- Declare given symbols as entry points; functions of same names in <grammar>.ml

10/25/11

49

## Ocamlyacc <declarations>

- **%type** <type> *symbol ... symbol*  
Specify type of attributes for given symbols. Mandatory for start symbols
- **%left** *symbol ... symbol*
- **%right** *symbol ... symbol*
- **%nonassoc** *symbol ... symbol*  
Associate precedence and associativity to given symbols. Same line, same precedence; earlier line, lower precedence (broadest scope)

10/25/11

50

## Ocamlyacc <rules>

- **nonterminal** :  
*symbol ... symbol { semantic\_action }*  
| ...  
| *symbol ... symbol { semantic\_action }*  
| ;
- Semantic actions are arbitrary Ocaml expressions
- Must be of same type as declared (or inferred) for *nonterminal*
- Access semantic attributes (values) of symbols by position: \$1 for first symbol, \$2 to second ...

10/25/11

51

## Example - Base types

```
(* File: expr.ml *)
type expr =
  Term_as_Expr of term
  | Plus_Expr of (term * expr)
  | Minus_Expr of (term * expr)
and term =
  Factor_as_Term of factor
  | Mult_Term of (factor * term)
  | Div_Term of (factor * term)
and factor =
  Id_as_Factor of string
  | Parenthesized_Expr_as_Factor of expr
```

10/25/11

52

## Example - Lexer (explex.ml)

```
{ (*open Exprparse*) }
let numeric = ['0' - '9']
let letter = ['a' - 'z' 'A' - 'Z']
rule token = parse
| "+" {Plus_token}
| "-" {Minus_token}
| "*" {Times_token}
| "/" {Divide_token}
| "(" {Left_parenthesis}
| ")" {Right_parenthesis}
| letter (letter|numeric|"_")* as id {Id_token id}
| [' '\t' '\n'] {token lexbuf}
| eof {EOL}
```

10/25/11

53

## Example - Parser (exprparse.mly)

```
%{ open Expr
%}
%token <string> Id_token
%token Left_parenthesis Right_parenthesis
%token Times_token Divide_token
%token Plus_token Minus_token
%token EOL
%start main
%type <expr> main
%%
```

10/25/11

54

## Example - Parser (exprparse.mly)

```
expr:
  term
    { Term_as_Expr $1 }
  | term Plus_token expr
    { Plus_Expr ($1, $3) }
  | term Minus_token expr
    { Minus_Expr ($1, $3) }
```

10/25/11

55

## Example - Parser (exprparse.mly)

```
term:
  factor
    { Factor_as_Term $1 }
  | factor Times_token term
    { Mult_Term ($1, $3) }
  | factor Divide_token term
    { Div_Term ($1, $3) }
```

10/25/11

56

## Example - Parser (exprparse.mly)

```
factor:
  Id_token
    { Id_as_Factor $1 }
  | Left_parenthesis expr Right_parenthesis
    { Parenthesized_Expr_as_Factor $2 }
main:
  | expr EOL
    { $1 }
```

10/25/11

57

## Example - Using Parser

```
# #use "expr.ml";;
...
# #use "exprparse.ml";;
...
# #use "exprlex.ml";;
...
# let test s =
  let lexbuf = Lexing.from_string (s^"\n") in
  main token lexbuf;;
```

10/25/11

58

## Example - Using Parser

```
# test "a + b";;
- : expr =
Plus_Expr
(
  Factor_as_Term (Id_as_Factor "a"),
  Term_as_Expr (Factor_as_Term
    (Id_as_Factor "b")))

```

10/25/11
