

Programming Languages and Compilers (CS 421)

Elsa L Gunter
2112 SC, UIUC

<http://courses.engr.illinois.edu/cs421>

Based in part on slides by Mattox Beckman, as updated by Vikram Adve and Gul Agha

9/1/16

1

Your turn now

Try steps 1 - 3 from
WA0-practice

9/1/16

2

Functions

```
# let plus_two n = n + 2;;  
val plus_two : int -> int = <fun>  
# plus_two 17;;  
- : int = 19  
# let plus_two = fun n -> n + 2;;  
val plus_two : int -> int = <fun>  
# plus_two 14;;  
- : int = 16
```

First definition syntactic sugar for second

9/1/16

3

Using a nameless function

```
# (fun x -> x * 3) 5;; (* An application *)  
- : int = 15  
# ((fun y -> y +. 2.0), (fun z -> z * 3));;  
(* As data *)  
- : (float -> float) * (int -> int) = (<fun>, <fun>)
```

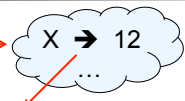

Note: in fun v -> exp(v), scope of variable is only the body exp(v)

9/1/16

4

Values fixed at declaration time

```
# let x = 12;;  
val x : int = 12  
# let plus_x y = y + x;;  
val plus_x : int -> int = <fun>  
# plus_x 3;;
```

What is the result?

9/1/16

5

Values fixed at declaration time

```
# let x = 12;;  
val x : int = 12  
# let plus_x y = y + x;;  
val plus_x : int -> int = <fun>  
# plus_x 3;;  
- : int = 15
```

9/1/16

6

Values fixed at declaration time

```
# let x = 7;; (* New declaration, not an
update *)
val x : int = 7

# plus_x 3;;
```

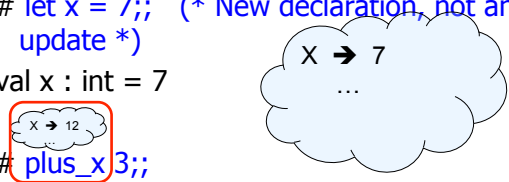

What is the result this time?

9/1/16

7

Values fixed at declaration time

```
# let x = 7;; (* New declaration, not an
update *)
val x : int = 7
# plus_x 3;;
```

What is the result this time?

9/1/16

8

Values fixed at declaration time

```
# let x = 7;; (* New declaration, not an
update *)
val x : int = 7

# plus_x 3;;
- : int = 15
```

9/1/16

9

Question

- Observation: Functions are first-class values in this language
- Question: What value does the environment record for a function variable?
- Answer: a closure

9/1/16

10

Save the Environment!

- A *closure* is a pair of an environment and an association of a sequence of variables (the input variables) with an expression (the function body), written:
 $f \rightarrow \langle (v_1, \dots, v_n) \rightarrow \text{exp}, \rho_f \rangle$
- Where ρ_f is the environment in effect when f is defined (if f is a simple function)

9/1/16

11

Closure for plus_x

- When plus_x was defined, had environment:
 $\rho_{\text{plus_x}} = \{\dots, x \rightarrow 12, \dots\}$
- Recall: `let plus_x y = y + x`
is really `let plus_x = fun y -> y + x`
- Closure for `fun y -> y + x`:
 $\langle y \rightarrow y + x, \rho_{\text{plus_x}} \rangle$
- Environment just after plus_x defined:
 $\{\text{plus_x} \rightarrow \langle y \rightarrow y + x, \rho_{\text{plus_x}} \rangle\} + \rho_{\text{plus_x}}$

9/1/16

12

Now it's your turn

You should be able to do remainder
of WA0-practice

9/1/16

13

Match Expressions

```
# let triple_to_pair triple =
```

```
  match triple
  with (0, x, y) -> (x, y)
       | (x, 0, y) -> (x, y)
       | (x, y, _) -> (x, y);;
```

- Each clause: pattern on left, expression on right
- Each x, y has scope of only its clause
- Use first matching clause

```
val triple_to_pair : int * int * int -> int * int =  
  <fun>
```

9/1/16

14

Recursive Functions

```
# let rec factorial n =  
  if n = 0 then 1 else n * factorial (n - 1);;  
val factorial : int -> int = <fun>  
# factorial 5;;  
- : int = 120  
# (* rec is needed for recursive function  
   declarations *)
```

9/1/16

15

Recursion Example

Compute n^2 recursively using:

$$n^2 = (2 * n - 1) + (n - 1)^2$$

```
# let rec nthsq n = (* rec for recursion *)  
  match n (* pattern matching for cases *)  
  with 0 -> 0 (* base case *)  
       | n -> (2 * n - 1) (* recursive case *)  
           + nthsq (n - 1);; (* recursive call *)  
val nthsq : int -> int = <fun>  
# nthsq 3;;  
- : int = 9
```

Structure of recursion similar to inductive proof

9/1/16

16

Recursion and Induction

```
# let rec nthsq n = match n with 0 -> 0  
  | n -> (2 * n - 1) + nthsq (n - 1) ;;
```

- Base case is the last case; it stops the computation
- Recursive call must be to arguments that are somehow smaller - must progress to base case
- **if** or **match** must contain base case
- Failure of these may cause failure of termination

9/1/16

17

Lists

- First example of a recursive datatype (aka algebraic datatype)
- Unlike tuples, lists are homogeneous in type (all elements same type)

9/1/16

18

Lists

- List can take one of two forms:
 - Empty list, written []
 - Non-empty list, written `x :: xs`
 - `x` is head element, `xs` is tail list, `::` called “cons”
 - Syntactic sugar: `[x] == x :: []`
 - `[x1; x2; ...; xn] == x1 :: x2 :: ... :: xn :: []`

9/1/16

19

Lists

```
# let fib5 = [8;5;3;2;1;1];;
val fib5 : int list = [8; 5; 3; 2; 1; 1]
# let fib6 = 13 :: fib5;;
val fib6 : int list = [13; 8; 5; 3; 2; 1; 1]
# (8::5::3::2::1::1::[ ]) = fib5;;
- : bool = true
# fib5 @ fib6;;
- : int list = [8; 5; 3; 2; 1; 1; 13; 8; 5; 3; 2; 1; 1]
```

9/1/16

20

Lists are Homogeneous

```
# let bad_list = [1; 3.2; 7];;
```

Characters 19-22:

```
let bad_list = [1; 3.2; 7];;
                ^^^
```

This expression has type float but is here used with type int

9/1/16

21

Question

- Which one of these lists is invalid?
 - [2; 3; 4; 6]
 - [2,3; 4,5; 6,7]
 - [(2.3,4); (3.2,5); (6,7.2)]
 - [["hi"; "there"]; ["wahcha"]; []; ["doin"]]

9/1/16

22

Answer

- Which one of these lists is invalid?
 - [2; 3; 4; 6]
 - [2,3; 4,5; 6,7]
 - [(2.3,4); (3.2,5); (6,7.2)]
 - [["hi"; "there"]; ["wahcha"]; []; ["doin"]]
- 3 is invalid because of last pair

9/1/16

23

Functions Over Lists

```
# let rec double_up list =
  match list
  with [ ] -> [ ] (* pattern before ->,
                  expression after *)
       | (x :: xs) -> (x :: x :: double_up xs);;
val double_up : 'a list -> 'a list = <fun>
# let fib5_2 = double_up fib5;;
val fib5_2 : int list = [8; 8; 5; 5; 3; 3; 2; 2; 1; 1; 1]
```

9/1/16

24

Functions Over Lists

```
# let silly = double_up ["hi"; "there"];  
val silly : string list = ["hi"; "hi"; "there"; "there"]  
# let rec poor_rev list =  
  match list  
  with [] -> []  
       | (x::xs) -> poor_rev xs @ [x];;  
val poor_rev : 'a list -> 'a list = <fun>  
# poor_rev silly;;  
- : string list = ["there"; "there"; "hi"; "hi"]
```

9/1/16

25

Question: Length of list

- Problem: write code for the length of the list
 - How to start?

```
let length l =
```

9/1/16

26

Question: Length of list

- Problem: write code for the length of the list
 - How to start?

```
let rec length l =  
  match l with
```

9/1/16

27

Question: Length of list

- Problem: write code for the length of the list
 - What patterns should we match against?

```
let rec length l =  
  match l with
```

9/1/16

28

Question: Length of list

- Problem: write code for the length of the list
 - What patterns should we match against?

```
let rec length l =  
  match l with [] ->  
               | (a :: bs) ->
```

9/1/16

29

Question: Length of list

- Problem: write code for the length of the list
 - What result do we give when l is empty?

```
let rec length l =  
  match l with [] -> 0  
               | (a :: bs) ->
```

9/1/16

30

Question: Length of list

- Problem: write code for the length of the list
 - What result do we give when `l` is not empty?

```
let rec length l =  
  match l with [] -> 0  
  | (a :: bs) ->
```

9/1/16

31

Question: Length of list

- Problem: write code for the length of the list
 - What result do we give when `l` is not empty?

```
let rec length l =  
  match l with [] -> 0  
  | (a :: bs) -> 1 + length bs
```

9/1/16

32

Same Length

- How can we efficiently answer if two lists have the same length?

9/1/16

33

Same Length

- How can we efficiently answer if two lists have the same length?

```
let rec same_length list1 list2 =  
  match list1 with [] ->  
    (match list2 with [] -> true  
     | (y::ys) -> false)  
  | (x::xs) ->  
    (match list2 with [] -> false  
     | (y::ys) -> same_length xs ys)
```

9/1/16

34

Functions with more than one argument

```
# let add_three x y z = x + y + z;;  
val add_three : int -> int -> int -> int = <fun>  
# let t = add_three 6 3 2;;  
val t : int = 11  
# let add_three =  
  fun x -> (fun y -> (fun z -> x + y + z));;  
val add_three : int -> int -> int -> int = <fun>
```

Again, first syntactic sugar for second

9/1/16

35

Partial application of functions

```
let add_three x y z = x + y + z;;  
  
# let h = add_three 5 4;;  
val h : int -> int = <fun>  
# h 3;;  
- : int = 12  
# h 7;;  
- : int = 16
```

9/1/16

36

Functions as arguments

```
# let thrice f x = f (f (f x));;
val thrice : ('a -> 'a) -> 'a -> 'a = <fun>
# let g = thrice plus_two;;
val g : int -> int = <fun>
# g 4;;
- : int = 10
# thrice (fun s -> "Hi! " ^ s) "Good-bye!";;
- : string = "Hi! Hi! Hi! Good-bye!"
```

9/1/16

37

Functions on tuples

```
# let plus_pair (n,m) = n + m;;
val plus_pair : int * int -> int = <fun>
# plus_pair (3,4);;
- : int = 7
# let double x = (x,x);;
val double : 'a -> 'a * 'a = <fun>
# double 3;;
- : int * int = (3, 3)
# double "hi";;
- : string * string = ("hi", "hi")
```

9/1/16

38

Closure for plus_pair

- Assume $\rho_{\text{plus_pair}}$ was the environment just before `plus_pair` defined
- Closure for `plus_pair`:
 $\langle (n,m) \rightarrow n + m, \rho_{\text{plus_pair}} \rangle$
- Environment just after `plus_pair` defined:
 $\{\text{plus_pair} \rightarrow \langle (n,m) \rightarrow n + m, \rho_{\text{plus_pair}} \rangle\}$
 $+ \rho_{\text{plus_pair}}$

9/1/16

39

Warm-up Scoping Question

Consider this code:

```
let x = 27;;
let f x =
  let x = 5 in
    (fun x -> print_int x) 10;;
f 12;;
```

What value is printed?

5
10
12
27

9/1/16

40

Recall: let plus_x = fun x => y + x

let x = 12

let plus_x = fun y => y + x

let x = 7

9/1/16

41

Closure for plus_x

- When `plus_x` was defined, had environment:
 $\rho_{\text{plus_x}} = \{\dots, x \rightarrow 12, \dots\}$
- Recall: `let plus_x y = y + x`
 is really `let plus_x = fun y -> y + x`
- Closure for `fun y -> y + x`:
 $\langle y \rightarrow y + x, \rho_{\text{plus_x}} \rangle$
- Environment just after `plus_x` defined:
 $\{\text{plus_x} \rightarrow \langle y \rightarrow y + x, \rho_{\text{plus_x}} \rangle\} + \rho_{\text{plus_x}}$

9/1/16

42

Functions on tuples

```
# let plus_pair (n,m) = n + m;;
val plus_pair : int * int -> int = <fun>
# plus_pair (3,4);;
- : int = 7
# let double x = (x,x);;
val double : 'a -> 'a * 'a = <fun>
# double 3;;
- : int * int = (3, 3)
# double "hi";;
- : string * string = ("hi", "hi")
```

9/1/16

43

Save the Environment!

- A *closure* is a pair of an environment and an association of a sequence of variables (the input variables) with an expression (the function body), written:
$$\langle (v_1, \dots, v_n) \rightarrow \text{exp}, \rho \rangle$$
- Where ρ is the environment in effect when the function is defined (for a simple function)

9/1/16

44

Closure for plus_pair

- Assume $\rho_{\text{plus_pair}}$ was the environment just before `plus_pair` defined
- Closure for `fun (n,m) -> n + m`:
$$\langle (n,m) \rightarrow n + m, \rho_{\text{plus_pair}} \rangle$$
- Environment just after `plus_pair` defined:
$$\{ \text{plus_pair} \rightarrow \langle (n,m) \rightarrow n + m, \rho_{\text{plus_pair}} \rangle \}$$

$$+ \rho_{\text{plus_pair}}$$

9/1/16

45

Functions with more than one argument

```
# let add_three x y z = x + y + z;;
val add_three : int -> int -> int -> int = <fun>
# let t = add_three 6 3 2;;
val t : int = 11
# let add_three =
  fun x -> (fun y -> (fun z -> x + y + z));;
val add_three : int -> int -> int -> int = <fun>
```

Again, first syntactic sugar for second

9/1/16

46

Curried vs Uncurried

- Recall
`val add_three : int -> int -> int -> int = <fun>`
- How does it differ from
`# let add_triple (u,v,w) = u + v + w;;`
`val add_triple : int * int * int -> int = <fun>`
- `add_three` is *curried*;
- `add_triple` is *uncurried*

9/1/16

47

Curried vs Uncurried

```
# add_triple (6,3,2);;
- : int = 11
# add_triple 5 4;;
Characters 0-10:
  add_triple 5 4;;
  ^^^^^^^^^^^^
This function is applied to too many arguments,
maybe you forgot a `';
# fun x -> add_triple (5,4,x);;
: int -> int = <fun>
```

9/1/16

48

Partial application of functions

```
let add_three x y z = x + y + z;;
```

```
# let h = add_three 5 4;;  
val h : int -> int = <fun>  
# h 3;;  
- : int = 12  
# h 7;;  
- : int = 16
```

9/1/16

49

Your turn now

Try later parts from WA1
Caution!
Know what the argument is
and what the body is

9/1/16

50

Functions as arguments

```
# let thrice f x = f (f (f x));;  
val thrice : ('a -> 'a) -> 'a -> 'a = <fun>  
# let g = thrice plus_two;;  
val g : int -> int = <fun>  
# g 4;;  
- : int = 10  
# thrice (fun s -> "Hi! " ^ s) "Good-bye!";;  
- : string = "Hi! Hi! Hi! Good-bye!"
```

9/1/16

51

Evaluating declarations

- Evaluation uses an environment ρ
- To evaluate a (simple) declaration `let x = e`
 - Evaluate expression e in ρ to value v
 - Update ρ with x v : $\{x \rightarrow v\} + \rho$
- Update: $\rho_1 + \rho_2$ has all the bindings in ρ_1 and all those in ρ_2 that are not rebound in ρ_1
 $\{x \rightarrow 2, y \rightarrow 3, a \rightarrow \text{"hi"}\} + \{y \rightarrow 100, b \rightarrow 6\}$
 $= \{x \rightarrow 2, y \rightarrow 3, a \rightarrow \text{"hi"}, b \rightarrow 6\}$

9/1/16

52

Evaluating expressions

- Evaluation uses an environment ρ
- A constant evaluates to itself
- To evaluate an variable, look it up in ρ ($\rho(v)$)
- To evaluate uses of $+$, $-$, etc, eval args, then do operation
- Function expression evaluates to its closure
- To evaluate a local dec: `let x = e1 in e2`
 - Eval $e1$ to v , eval $e2$ using $\{x \rightarrow v\} + \rho$

9/1/16

53

Evaluation of Application with Closures

- In environment ρ , evaluate left term to closure, $c = \langle (x_1, \dots, x_n) \rightarrow b, \rho \rangle$
- (x_1, \dots, x_n) variables in (first) argument
- Evaluate the right term to value (v_1, \dots, v_n)
- Update the environment ρ to
 $\rho' = \{x_1 \rightarrow v_1, \dots, x_n \rightarrow v_n\} + \rho$
- Evaluate body b in environment ρ'

9/1/16

54

Evaluation of Application of plus_x;;

- Have environment:
 $\rho = \{\text{plus_x} \rightarrow \langle y \rightarrow y + x, \rho_{\text{plus_x}} \rangle, \dots, y \rightarrow 3, \dots\}$
where $\rho_{\text{plus_x}} = \{x \rightarrow 12, \dots\}$
- Eval (plus_x y, ρ) rewrites to
- App ($\langle y \rightarrow y + x, \rho_{\text{plus_x}} \rangle, 3$) rewrites to
- Eval ($y + x, \{y \rightarrow 3\} + \rho_{\text{plus_x}}$) rewrites to
- Eval ($3 + 12, \rho_{\text{plus_x}}$) = 15

9/1/16

55

Evaluation of Application of plus_pair

- Assume environment
 $\rho = \{x \rightarrow 3, \dots, \text{plus_pair} \rightarrow \langle (n,m) \rightarrow n + m, \rho_{\text{plus_pair}} \rangle\} + \rho_{\text{plus_pair}}$
- Eval (plus_pair (4,x), ρ) =
- App ($\langle (n,m) \rightarrow n + m, \rho_{\text{plus_pair}} \rangle, (4,3)$) =
- Eval ($n + m, \{n \rightarrow 4, m \rightarrow 3\} + \rho_{\text{plus_pair}}$) =
- Eval ($4 + 3, \{n \rightarrow 4, m \rightarrow 3\} + \rho_{\text{plus_pair}}$) = 7

9/1/16

56

Closure question

- If we start in an empty environment, and we execute:
`let f = fun n -> n + 5;;`
(* 0 *)
`let pair_map g (n,m) = (g n, g m);;`
`let f = pair_map f;;`
`let a = f (4,6);;`
What is the environment at (* 0 *)?

9/1/16

57

Answer

```
let f = fun n -> n + 5;;  
 $\rho_0 = \{f \rightarrow \langle n \rightarrow n + 5, \{ \} \rangle\}$ 
```

9/1/16

58

Closure question

- If we start in an empty environment, and we execute:
`let f = fun => n + 5;;`
`let pair_map g (n,m) = (g n, g m);;`
(* 1 *)
`let f = pair_map f;;`
`let a = f (4,6);;`
What is the environment at (* 1 *)?

9/1/16

59

Answer

```
 $\rho_0 = \{f \rightarrow \langle n \rightarrow n + 5, \{ \} \rangle\}$   
let pair_map g (n,m) = (g n, g m);;  
 $\rho_1 = \{\text{pair\_map} \rightarrow$   
     $\langle g \rightarrow \text{fun } (n,m) \rightarrow (g n, g m),$   
     $\{f \rightarrow \langle n \rightarrow n + 5, \{ \} \rangle\} \rangle,$   
     $f \rightarrow \langle n \rightarrow n + 5, \{ \} \rangle\}$ 
```

9/1/16

60

Closure question

- If we start in an empty environment, and we execute:

```
let f = fun => n + 5;;
```

```
let pair_map g (n,m) = (g n, g m);;
```

```
let f = pair_map f;;
```

(* 2 *)

```
let a = f (4,6);;
```

What is the environment at (* 2 *)?

9/1/16

61

Evaluate pair_map f

$$\rho_0 = \{f \rightarrow \langle n \rightarrow n + 5, \{ \} \rangle\}$$
$$\rho_1 = \{\text{pair_map} \rightarrow \langle g \rightarrow \text{fun } (n,m) \rightarrow (g \ n, \ g \ m), \rho_0 \rangle, \\ f \rightarrow \langle n \rightarrow n + 5, \{ \} \rangle\}$$

```
let f = pair_map f;;
```

9/1/16

62

Evaluate pair_map f

$$\rho_0 = \{f \rightarrow \langle n \rightarrow n + 5, \{ \} \rangle\}$$
$$\rho_1 = \{\text{pair_map} \rightarrow \langle g \rightarrow \text{fun } (n,m) \rightarrow (g \ n, \ g \ m), \rho_0 \rangle, \\ f \rightarrow \langle n \rightarrow n + 5, \{ \} \rangle\}$$

Eval(pair_map f, ρ_1) =

9/1/16

63

Evaluate pair_map f

$$\rho_0 = \{f \rightarrow \langle n \rightarrow n + 5, \{ \} \rangle\}$$
$$\rho_1 = \{\text{pair_map} \rightarrow \langle g \rightarrow \text{fun } (n,m) \rightarrow (g \ n, \ g \ m), \rho_0 \rangle, \\ f \rightarrow \langle n \rightarrow n + 5, \{ \} \rangle\}$$

Eval(pair_map f, ρ_1) =

App ($\langle g \rightarrow \text{fun } (n,m) \rightarrow (g \ n, \ g \ m), \rho_0 \rangle$,
 $\langle n \rightarrow n + 5, \{ \} \rangle$) =

9/1/16

64

Evaluate pair_map f

$$\rho_0 = \{f \rightarrow \langle n \rightarrow n + 5, \{ \} \rangle\}$$
$$\rho_1 = \{\text{pair_map} \rightarrow \langle g \rightarrow \text{fun } (n,m) \rightarrow (g \ n, \ g \ m), \rho_0 \rangle, \\ f \rightarrow \langle n \rightarrow n + 5, \{ \} \rangle\}$$

Eval(pair_map f, ρ_1) =

App ($\langle g \rightarrow \text{fun } (n,m) \rightarrow (g \ n, \ g \ m), \rho_0 \rangle$,
 $\langle n \rightarrow n + 5, \{ \} \rangle$) =

Eval(fun (n,m) -> (g n, g m), {g -> $\langle n \rightarrow n + 5, \{ \} \rangle$ } + ρ_0)

= $\langle (n,m) \rightarrow (g \ n, \ g \ m), \{g \rightarrow \langle n \rightarrow n + 5, \{ \} \rangle\} + \rho_0$

= $\langle (n,m) \rightarrow (g \ n, \ g \ m), \{g \rightarrow \langle n \rightarrow n + 5, \{ \} \rangle, \\ f \rightarrow \langle n \rightarrow n + 5, \{ \} \rangle\}$

9/1/16

65

Answer

$$\rho_1 = \{\text{pair_map} \rightarrow$$
$$\langle g \rightarrow \text{fun } (n,m) \rightarrow (g \ n, \ g \ m), \{f \rightarrow \langle n \rightarrow n + 5, \{ \} \rangle\}\rangle,$$

```
let f = pair_map f;;
```

$$\rho_2 = \{f \rightarrow \langle (n,m) \rightarrow (g \ n, \ g \ m),$$
$$\{g \rightarrow \langle n \rightarrow n + 5, \{ \} \rangle,$$
$$f \rightarrow \langle n \rightarrow n + 5, \{ \} \rangle\}\rangle,$$
$$\text{pair_map} \rightarrow \langle g \rightarrow \text{fun } (n,m) \rightarrow (g \ n, \ g \ m), \\ \{f \rightarrow \langle n \rightarrow n + 5, \{ \} \rangle\}\rangle\}$$

9/1/16

66

Closure question

- If we start in an empty environment, and we execute:

```
let f = fun => n + 5;;
```

```
let pair_map g (n,m) = (g n, g m);;
```

```
let f = pair_map f;;
```

```
let a = f (4,6);;
```

(* 3 *)

What is the environment at (* 3 *)?

9/1/16

67

Final Evaluation?

```
 $\rho_2 = \{f \rightarrow \langle (n,m) \rightarrow (g\ n, g\ m),$   
           $\{g \rightarrow \langle n \rightarrow n + 5, \{ \} \rangle,$   
           $f \rightarrow \langle n \rightarrow n + 5, \{ \} \rangle \rangle \},$   
           $pair\_map \rightarrow \langle g \rightarrow fun\ (n,m) \rightarrow (g\ n, g\ m),$   
           $\{f \rightarrow \langle n \rightarrow n + 5, \{ \} \rangle \rangle \}$ 
```

```
let a = f (4,6);;
```

9/1/16

68

Evaluate f (4,6);;

```
 $\rho_2 = \{f \rightarrow \langle (n,m) \rightarrow (g\ n, g\ m),$   
           $\{g \rightarrow \langle n \rightarrow n + 5, \{ \} \rangle,$   
           $f \rightarrow \langle n \rightarrow n + 5, \{ \} \rangle \rangle \},$   
           $pair\_map \rightarrow \langle g \rightarrow fun\ (n,m) \rightarrow (g\ n, g\ m),$   
           $\{f \rightarrow \langle n \rightarrow n + 5, \{ \} \rangle \rangle \}$ 
```

```
Eval(f (4,6),  $\rho_2$ ) =
```

9/1/16

69

Evaluate f (4,6);;

```
 $\rho_2 = \{f \rightarrow \langle (n,m) \rightarrow (g\ n, g\ m),$   
           $\{g \rightarrow \langle n \rightarrow n + 5, \{ \} \rangle,$   
           $f \rightarrow \langle n \rightarrow n + 5, \{ \} \rangle \rangle \},$   
           $pair\_map \rightarrow \langle g \rightarrow fun\ (n,m) \rightarrow (g\ n, g\ m),$   
           $\{f \rightarrow \langle n \rightarrow n + 5, \{ \} \rangle \rangle \}$ 
```

```
Eval(f (4,6),  $\rho_2$ ) =
```

```
App( $\langle (n,m) \rightarrow (g\ n, g\ m), \{g \rightarrow \langle n \rightarrow n + 5, \{ \} \rangle,$   
           $f \rightarrow \langle n \rightarrow n + 5, \{ \} \rangle \rangle \},$   
      (4,6)) =
```

9/1/16

70

Evaluate f (4,6);;

```
App( $\langle (n,m) \rightarrow (g\ n, g\ m), \{g \rightarrow \langle n \rightarrow n + 5, \{ \} \rangle,$   
           $f \rightarrow \langle n \rightarrow n + 5, \{ \} \rangle \rangle \},$ 
```

```
      (4,6)) =
```

```
Eval((g n, g m), {n → 4, m → 6} +  
          {g → <n → n + 5, { }>,  
          f → <n → n + 5, { }>>}) =
```

```
Eval((App(<n → n + 5, { }>, 4),  
      App (<n → n + 5, { }>, 6)),  
      {n → 4, m → 6, g → <n → n + 5, { }>,  
      f → <n → n + 5, { }>>}) =
```

9/1/16

71

Evaluate f (4,6);;

```
 $\rho_3 = \{n \rightarrow 4, m \rightarrow 6, g \rightarrow \langle n \rightarrow n + 5, \{ \} \rangle,$   
           $f \rightarrow \langle n \rightarrow n + 5, \{ \} \rangle \}$ 
```

```
Eval((App(<n → n + 5, { }>, 4),  
      App (<n → n + 5, { }>, 6)),  $\rho_3$ ) =
```

```
Eval((Eval(n + 5, {n → 4} + { }),  
      (Eval(n + 5, {n → 6} + { }))),  $\rho_3$ ) =
```

```
Eval((Eval(4 + 5, {n → 4} + { }),  
      (Eval(6 + 5, {n → 6} + { }))),  $\rho_3$ ) =
```

```
Eval((9, 11),  $\rho_3$ ) = (9, 11)
```

9/1/16

72

Higher Order Functions

- A function is *higher-order* if it takes a function as an argument or returns one as a result

- Example:

```
# let compose f g = fun x -> f (g x);;
val compose : ('a -> 'b) -> ('c -> 'a) -> 'c -> 'b = <fun>
```

- The type `('a -> 'b) -> ('c -> 'a) -> 'c -> 'b` is a higher order type because of `('a -> 'b)` and `('c -> 'a)` and `-> 'c -> 'b`

9/1/16

73

Thrice

- Recall:

```
# let thrice f x = f (f (f x));;
val thrice : ('a -> 'a) -> 'a -> 'a = <fun>
```

- How do you write thrice with compose?

9/1/16

74

Thrice

- Recall:

```
# let thrice f x = f (f (f x));;
val thrice : ('a -> 'a) -> 'a -> 'a = <fun>
```

- How do you write thrice with compose?

```
# let thrice f = compose f (compose f f);;
val thrice : ('a -> 'a) -> 'a -> 'a = <fun>
```

- Is this the only way?

9/1/16

75

Partial Application

```
# (+);;
- : int -> int -> int = <fun>
# (+) 2 3;;
- : int = 5
# let plus_two = (+) 2;;
val plus_two : int -> int = <fun>
# plus_two 7;;
- : int = 9
```

- Partial application also called *sectioning*

9/1/16

76

Lambda Lifting

- You must remember the rules for evaluation when you use partial application

```
# let add_two = (+) (print_string "test\n"; 2);;
test
val add_two : int -> int = <fun>
# let add2 = (* lambda lifted *)
  fun x -> (+) (print_string "test\n"; 2) x;;
val add2 : int -> int = <fun>
```

9/1/16

77

Lambda Lifting

```
# thrice add_two 5;;
- : int = 11
# thrice add2 5;;
test
test
test
- : int = 11
```

- Lambda lifting delayed the evaluation of the argument to `(+)` until the second argument was supplied

9/1/16

78

Partial Application and “Unknown Types”

- Recall `compose plus_two`:
`# let f1 = compose plus_two;;`
`val f1 : ('a -> int) -> 'a -> int = <fun>`
- Compare to lambda lifted version:
`# let f2 = fun g -> compose plus_two g;;`
`val f2 : ('a -> int) -> 'a -> int = <fun>`
- What is the difference?

9/1/16

79

Partial Application and “Unknown Types”

- 'a can only be instantiated once for an expression
`# f1 plus_two;;`
`- : int -> int = <fun>`
`# f1 List.length;;`
Characters 3-14:
`f1 List.length;;`
`^^^^^^^^^^^^^^`
- This expression has type 'a list -> int but is here used with type int -> int

9/1/16

80

Partial Application and “Unknown Types”

- 'a can be repeatedly instantiated

```
# f2 plus_two;;  
- : int -> int = <fun>  
# f2 List.length;;  
- : 'a list -> int = <fun>
```

9/1/16

81

Functions Over Lists

```
# let rec map f list =  
  match list  
  with [] -> []  
       | (h::t) -> (f h) :: (map f t);;  
val map : ('a -> 'b) -> 'a list -> 'b list = <fun>  
# map plus_two fib5;;  
- : int list = [10; 7; 5; 4; 3; 3]  
# map (fun x -> x - 1) fib6;;  
: int list = [12; 7; 4; 2; 1; 0; 0]
```

9/1/16

82

Iterating over lists

```
# let rec fold_left f a list =  
  match list  
  with [] -> a  
       | (x :: xs) -> fold_left f (f a x) xs;;  
val fold_left : ('a -> 'b -> 'a) -> 'a -> 'b list -> 'a =  
  <fun>  
# fold_left  
  (fun () -> print_string)  
  ()  
  ["hi"; "there"];;  
hithere- : unit = ()
```

9/1/16

83

Iterating over lists

```
# let rec fold_right f list b =  
  match list  
  with [] -> b  
       | (x :: xs) -> f x (fold_right f xs b);;  
val fold_right : ('a -> 'b -> 'b) -> 'a list -> 'b -> 'b =  
  <fun>  
# fold_right  
  (fun s -> fun () -> print_string s)  
  ["hi"; "there"]  
  ();;  
therehi- : unit = ()
```

9/1/16

84

Structural Recursion

- Functions on recursive datatypes (eg lists) tend to be recursive
- Recursion over recursive datatypes generally by structural recursion
 - Recursive calls made to components of structure of the same recursive type
 - Base cases of recursive types stop the recursion of the function

9/1/16

85

Structural Recursion : List Example

```
# let rec length list = match list
  with [ ] -> 0 (* Nil case *)
       | x :: xs -> 1 + length xs;; (* Cons case *)
val length : 'a list -> int = <fun>
# length [5; 4; 3; 2];;
- : int = 4
```

- Nil case [] is base case
- Cons case recurses on component list xs

9/1/16

86

Forward Recursion

- In Structural Recursion, split input into components and (eventually) recurse
- Forward Recursion form of Structural Recursion
- In forward recursion, first call the function recursively on all recursive components, and then build final result from partial results
- Wait until whole structure has been traversed to start building answer

9/1/16

87

Forward Recursion: Examples

```
# let rec double_up list =
  match list
  with [ ] -> [ ]
       | (x :: xs) -> (x :: x :: double_up xs);;
val double_up : 'a list -> 'a list = <fun>

# let rec poor_rev list =
  match list
  with [] -> []
       | (x::xs) -> poor_rev xs @ [x];;
val poor_rev : 'a list -> 'a list = <fun>
```

9/1/16

88

Encoding Recursion with Fold

```
# let rec append list1 list2 = match list1 with
  [ ] -> list2 | x::xs -> x :: append xs list2;;
val append : 'a list -> 'a list -> 'a list = <fun>
```

Base Case

Operation

Recursive Call

```
# let append list1 list2 =
  fold_right (fun x y -> x :: y) list1 list2;;
val append : 'a list -> 'a list -> 'a list = <fun>
# append [1;2;3] [4;5;6];;
- : int list = [1; 2; 3; 4; 5; 6]
```

9/1/16

89

Mapping Recursion

- One common form of structural recursion applies a function to each element in the structure

```
# let rec doubleList list = match list
  with [ ] -> [ ]
       | x::xs -> 2 * x :: doubleList xs;;
val doubleList : int list -> int list = <fun>
# doubleList [2;3;4];;
- : int list = [4; 6; 8]
```

9/1/16

90

Mapping Recursion

- Can use the higher-order recursive map function instead of direct recursion

```
# let doubleList list =  
  List.map (fun x -> 2 * x) list;;  
val doubleList : int list -> int list = <fun>  
# doubleList [2;3;4];;  
- : int list = [4; 6; 8]
```

- Same function, but no rec

9/1/16

91

Folding Recursion

- Another common form “folds” an operation over the elements of the structure

```
# let rec multList list = match list  
  with [ ] -> 1  
       | x::xs -> x * multList xs;;  
val multList : int list -> int = <fun>  
# multList [2;4;6];;  
- : int = 48
```

- Computes $(2 * (4 * (6 * 1)))$

9/1/16

92

Folding Recursion

- multList folds to the right
- Same as:

```
# let multList list =  
  List.fold_right  
    (fun x -> fun p -> x * p)  
    list 1;;  
val multList : int list -> int = <fun>  
# multList [2;4;6];;  
- : int = 48
```

9/1/16

93

How long will it take?

- Remember the big-O notation from CS 225 and CS 273
- Question: given input of size n , how long to generate output?
- Express output time in terms of input size, omit constants and take biggest power

9/1/16

94

How long will it take?

Common big-O times:

- Constant time $O(1)$
 - input size doesn't matter
- Linear time $O(n)$
 - double input \Rightarrow double time
- Quadratic time $O(n^2)$
 - double input \Rightarrow quadruple time
- Exponential time $O(2^n)$
 - increment input \Rightarrow double time

9/1/16

95

Linear Time

- Expect most list operations to take linear time $O(n)$
- Each step of the recursion can be done in constant time
- Each step makes only one recursive call
- List example: `multList`, `append`
- Integer example: `factorial`

9/1/16

96

Quadratic Time

- Each step of the recursion takes time proportional to input
- Each step of the recursion makes only one recursive call.
- List example:

```
# let rec poor_rev list = match list
  with [] -> []
    | (x::xs) -> poor_rev xs @ [x];;
val poor_rev : 'a list -> 'a list = <fun>
```

9/1/16

97

Exponential running time

- Hideous running times on input of any size
- Each step of recursion takes constant time
- Each recursion makes two recursive calls
- Easy to write naïve code that is exponential for functions that can be linear

9/1/16

98

Exponential running time

```
# let rec naiveFib n = match n
  with 0 -> 0
    | 1 -> 1
    | _ -> naiveFib (n-1) + naiveFib (n-2);;
val naiveFib : int -> int = <fun>
```

9/1/16

99

An Important Optimization

- When a function call is made, the return address needs to be saved to the stack so we know to where to return when the call is finished
- What if f calls g and g calls h , but calling h is the last thing g does (a *tail call*)?

9/1/16

100

An Important Optimization

- When a function call is made, the return address needs to be saved to the stack so we know to where to return when the call is finished
- What if f calls g and g calls h , but calling h is the last thing g does (a *tail call*)?
- Then h can return directly to f instead of g

9/1/16

101

Tail Recursion

- A recursive program is tail recursive if all recursive calls are tail calls
- Tail recursive programs may be optimized to be implemented as loops, thus removing the function call overhead for the recursive calls
- Tail recursion generally requires extra “accumulator” arguments to pass partial results
 - May require an auxiliary function

9/1/16

102

Tail Recursion - Example

```
# let rec rev_aux list revlist =  
  match list with [ ] -> revlist  
  | x :: xs -> rev_aux xs (x::revlist);;  
val rev_aux : 'a list -> 'a list -> 'a list = <fun>
```

```
# let rev list = rev_aux list [ ];;  
val rev : 'a list -> 'a list = <fun>
```

- What is its running time?

9/1/16

103

Comparison

- poor_rev [1,2,3] =
- (poor_rev [2,3]) @ [1] =
- ((poor_rev [3]) @ [2]) @ [1] =
- ((poor_rev []) @ [3]) @ [2] @ [1] =
- (([] @ [3]) @ [2]) @ [1] =
- ([3] @ [2]) @ [1] =
- (3::([] @ [2])) @ [1] =
- [3,2] @ [1] =
- 3 :: ([2] @ [1]) =
- 3 :: (2::([] @ [1])) = [3, 2, 1]

9/1/16

104

Comparison

- rev [1,2,3] =
- rev_aux [1,2,3] [] =
- rev_aux [2,3] [1] =
- rev_aux [3] [2,1] =
- rev_aux [] [3,2,1] = [3,2,1]

9/1/16

105

Folding Functions over Lists

How are the following functions similar?

```
# let rec sumlist list = match list with  
  [ ] -> 0 | x::xs -> x + sumlist xs;;  
val sumlist : int list -> int = <fun>  
# sumlist [2;3;4];;  
- : int = 9  
# let rec prodlist list = match list with  
  [ ] -> 1 | x::xs -> x * prodlist xs;;  
val prodlist : int list -> int = <fun>  
# prodlist [2;3;4];;  
- : int = 24
```

9/1/16

106

Folding

```
# let rec fold_left f a list = match list  
  with [ ] -> a | (x :: xs) -> fold_left f (f a x) xs;;  
val fold_left : ('a -> 'b -> 'a) -> 'a -> 'b list -> 'a =  
  <fun>  
fold_left f a [x1; x2; ...; xn] = f(...(f (f a x1) x2)... )xn  
# let rec fold_right f list b = match list  
  with [ ] -> b | (x :: xs) -> f x (fold_right f xs b);;  
val fold_right : ('a -> 'b -> 'b) -> 'a list -> 'b -> 'b =  
  <fun>  
fold_right f [x1; x2; ...; xn] b = f x1(f x2(... (f xn b)...))
```

9/1/16

107

Folding - Forward Recursion

```
# let sumlist list = fold_right (+) list 0;;  
val sumlist : int list -> int = <fun>  
# sumlist [2;3;4];;  
- : int = 9  
# let prodlist list = fold_right ( * ) list 1;;  
val prodlist : int list -> int = <fun>  
# prodlist [2;3;4];;  
- : int = 24
```

9/1/16

108

Folding - Tail Recursion

```
- # let rev list =  
-   fold_left  
-   (fun l -> fun x -> x :: l) //comb op  
-   [] //accumulator cell  
-   list
```

9/1/16

109

Folding

- Can replace recursion by `fold_right` in any forward primitive recursive definition
 - Primitive recursive means it only recurses on immediate subcomponents of recursive data structure
- Can replace recursion by `fold_left` in any tail primitive recursive definition

9/1/16

110
