Programming Languages and Compilers (CS 421)

Elsa L Gunter 2112 SC, UIUC

http://courses.engr.illinois.edu/cs421

Based in part on slides by Mattox Beckman, as updated by Vikram Adve and Gul Agha

Terms

- A function is in Direct Style when it returns its result back to the caller.
- A Tail Call occurs when a function returns the result of another function call without any more computations (eg tail recursion)
- A function is in Continuation Passing Style when it, and every function call in it, passes its result to another function.
- Instead of returning the result to the caller, we pass it forward to another function.

Terminology

- Tail Position: A subexpression s of expressions e, such that if evaluated, will be taken as the value of e
 - if (x>3) then x + 2 else x 4
 let x = 5 in x + 4
- Tail Call: A function call that occurs in tail position
 - if (h x) then f x else $(x \pm g x)$

Terminology

- Available: A function call that can be executed by the current expression
- The fastest way to be unavailable is to be guarded by an abstraction (anonymous function, lambda lifted).
 - if (h x) then f x else (x + g x)
 - if (h x) then (fun x -> f x) else (g (x + x))

Not available

CPS Transformation

- Step 1: Add continuation argument to any function definition:
 - let f arg = e \Rightarrow let f arg k = e
 - Idea: Every function takes an extra parameter saying where the result goes
- Step 2: A simple expression in tail position should be passed to a continuation instead of returned:
 - return $a \Rightarrow k a$
 - Assuming a is a constant or variable.
 - "Simple" = "No available function calls."

CPS Transformation

- Step 3: Pass the current continuation to every function call in tail position
 - return f arg \Rightarrow f arg k
 - The function "isn't going to return," so we need to tell it where to put the result.

CPS Transformation

- Step 4: Each function call not in tail position needs to be converted to take a new continuation (containing the old continuation as appropriate)
 - return op (f arg) \Rightarrow f arg (fun r -> k(op r))
 - op represents a primitive operation
 - return $f(g arg) \Rightarrow g arg (fun r-> f r k)$

Example

Before:

let rec add_list lst = match lst with

```
[]-> 0
| 0 :: xs -> add_list xs
| x :: xs -> (+) x
   (add_list xs);;
```

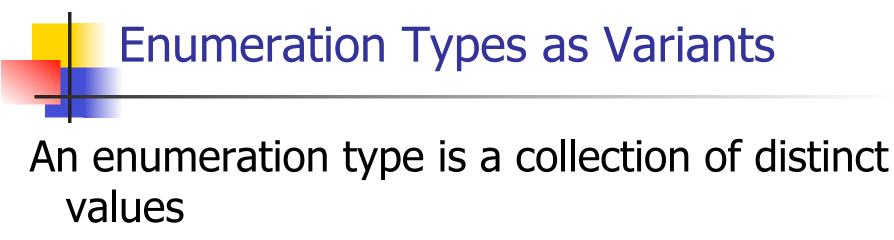

After:

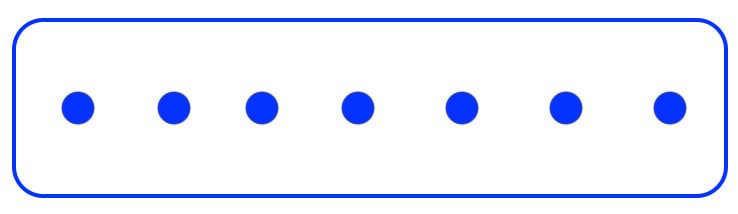

CPS for Higher Order Functions

- In CPS, every procedure / function takes a continuation to receive its result
- Procedures passed as arguments take continuations
- Procedures returned as results take continuations
- CPS version of higher-order functions must expect input procedures to take continuations

Variants - Syntax (slightly simplified)

- type $name = C_1 [of ty_1] | ... | C_n [of ty_n]$
- Introduce a type called name
- (fun x -> C_i x) : ty₁ -> name
- *C_i* is called a *constructor*; if the optional type argument is omitted, it is called a *constant*
- Constructors are the basis of almost all pattern matching

In C and Ocaml they have an order structure; order by order of input

Enumeration Types as Variants

type weekday = Monday | Tuesday | Wednesday | Thursday | Friday | Saturday | Sunday;; type weekday = Monday | Tuesday | Wednesday Thursday Friday Saturday

| Sunday

Functions over Enumerations

let day_after day = match day with Monday -> Tuesday Tuesday -> Wednesday | Wednesday -> Thursday | Thursday -> Friday Friday -> Saturday Saturday -> Sunday Sunday -> Monday;; val day after : weekday -> weekday = <fun>

Functions over Enumerations

let rec days_later n day = match n with 0 -> day -> if n > 0 then day_after (days_later (n - 1) day) else days later (n + 7) day;; val days later : int -> weekday -> weekday = < fun >

Functions over Enumerations

- # days_later 2 Tuesday;;
- : weekday = Thursday
- # days_later (-1) Wednesday;;
- : weekday = Tuesday
- # days_later (-4) Monday;;
- : weekday = Thursday

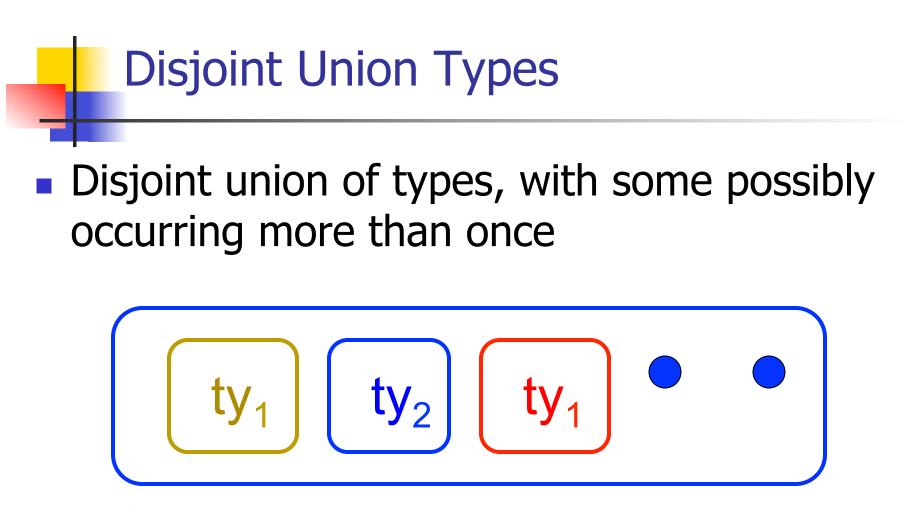

Problem:

type weekday = Monday | Tuesday | Wednesday | Thursday | Friday | Saturday | Sunday;; Write function is_weekend : weekday -> bool let is weekend day =

Problem:

type weekday = Monday | Tuesday | Wednesday | Thursday | Friday | Saturday | Sunday;; Write function is weekend : weekday -> bool let is weekend day = match day with Saturday -> true Sunday -> true -> false

Example Enumeration Types

We can also add in some new singleton elements

Disjoint Union Types

type id = DriversLicense of int SocialSecurity of int | Name of string;; type id = DriversLicense of int | SocialSecurity of int | Name of string # let check id id = match id with DriversLicense num -> not (List.mem num [13570; 99999]) SocialSecurity num -> num < 900000000 | Name str -> not (str = "John Doe");; val check id : id -> bool = <fun>

Problem

Create a type to represent the currencies for US, UK, Europe and Japan

Problem

 Create a type to represent the currencies for US, UK, Europe and Japan

type currency =

Dollar of int

| Pound of int

| Euro of int

| Yen of int

Example Disjoint Union Type

type const = **BoolConst of bool** | IntConst of int FloatConst of float StringConst of string NilConst UnitConst

Example Disjoint Union Type

How to represent 7 as a const?
Answer: IntConst 7

The type 'a option is gives us something to represent non-existence or failure

type 'a option = Some of 'a | None;;
type 'a option = Some of 'a | None

Used to encode partial functions
Often can replace the raising of an exception

Functions producing option

let rec first p list =
 match list with [] -> None
 | (x::xs) -> if p x then Some x else first p xs;;
val first : ('a -> bool) -> 'a list -> 'a option = <fun>
first (fun x -> x > 3) [1;3;4;2;5];;
- : int option = Some 4

- # first (fun x -> x > 5) [1;3;4;2;5];;
- : int option = None

Functions over option

- # let result_ok r =
 - match r with None -> false

Some _ -> true;;

- val result_ok : 'a option -> bool = <fun>
- # result_ok (first (fun x -> x > 3) [1;3;4;2;5]);;
- : bool = true
- # result_ok (first (fun x -> x > 5) [1;3;4;2;5]);;
- -: bool = false

Problem

Write a hd and tl on lists that doesn't raise an exception and works at all types of lists.

Problem

Write a hd and tl on lists that doesn't raise an exception and works at all types of lists.

let hd list = match list with [] -> None | (x::xs) -> Some x
let tl list = match list with [] -> None | (x::xs) -> Some xs Mapping over Variants

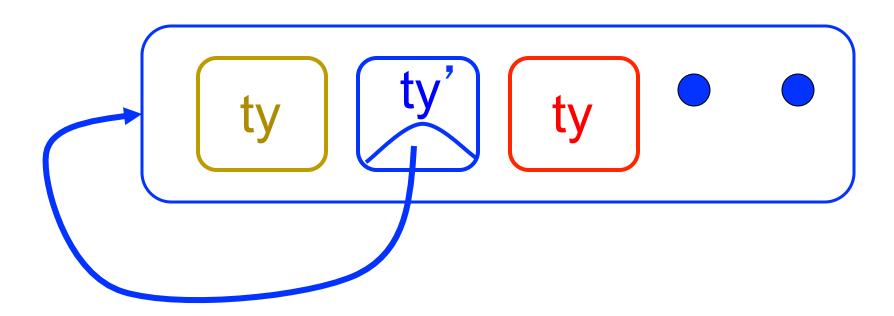

let optionMap f opt = match opt with None -> None | Some $x \rightarrow$ Some (f x);; val optionMap : (a -> b) -> a option -> boption = <fun> # optionMap (fun x -> x - 2) (first (fun x -> x > 3) [1;3;4;2;5]);; -: int option = Some 2

Folding over Variants

let optionFold someFun noneVal opt = match opt with None -> noneVal Some x -> someFun x;; val optionFold : ('a \rightarrow 'b) \rightarrow 'b \rightarrow 'a option \rightarrow $b = \langle fun \rangle$ # let optionMap f opt = optionFold (fun x -> Some (f x)) None opt;; val optionMap : (a -> b) -> a option -> boption = < fun >

The type being defined may be a component of itself

type exp =

- VarExp of string
- | ConstExp of const
- | MonOpAppExp of mon_op * exp
- | BinOpAppExp of bin_op * exp * exp
- | IfExp of exp* exp * exp
- | AppExp of exp * exp
- | FunExp of string * exp

- How to represent 6 as an exp?

- How to represent 6 as an exp?
- Answer: ConstExp (IntConst 6)

- How to represent (6, 3) as an exp?

Recursive Data Types

- How to represent (6, 3) as an exp?
- BinOpAppExp (CommaOp, ConstExp (IntConst 6), ConstExp (IntConst 3))

Recursive Data Types

- # type bin_op = IntPlusOp | IntMinusOp | EqOp | CommaOp | ConsOp | ... # type const = BoolConst of bool | IntConst of int | ...
- # type exp = VarExp of string | ConstExp of const | BinOpAppExp of bin_op * exp * exp | ...
- How to represent [(6, 3)] as an exp?
- BinOpAppExp (ConsOp, BinOpAppExp (CommaOp, ConstExp (IntConst 6), ConstExp (IntConst 3)), ConstExp NilConst))));;

Your turn now

Try Problem 1 on MP3

Recursive Data Types

type int_Bin_Tree =

Leaf of int | Node of (int_Bin_Tree *
 int_Bin_Tree);;

type int_Bin_Tree = Leaf of int | Node of (int_Bin_Tree * int_Bin_Tree)

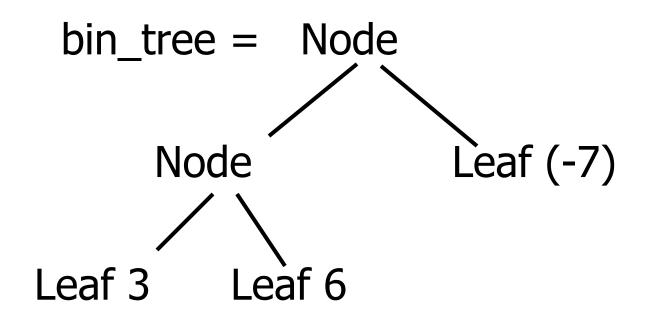

Recursive Data Type Values

let bin_tree =

Node(Node(Leaf 3, Leaf 6),Leaf (-7));;

val bin_tree : int_Bin_Tree = Node (Node (Leaf 3, Leaf 6), Leaf (-7))

Recursive Functions

let rec first_leaf_value tree =
 match tree with (Leaf n) -> n
 | Node (left_tree, right_tree) ->
 first_leaf_value left_tree;;
val first_leaf_value : int_Bin_Tree -> int =
 <fun>

let left = first_leaf_value bin_tree;;
val left : int = 3

Problem

type int_Bin_Tree =Leaf of int

- Node of (int_Bin_Tree * int_Bin_Tree);;
- Write sum_tree : int_Bin_Tree -> int
- Adds all ints in tree
- let rec sum_tree t =

Problem

type int_Bin_Tree =Leaf of int

- Node of (int_Bin_Tree * int_Bin_Tree);;
- Write sum_tree : int_Bin_Tree -> int
- Adds all ints in tree
- let rec sum_tree t =
 - match t with Leaf n -> n
 - Node(t1,t2) -> sum_tree t1 + sum_tree t2

Mapping over Recursive Types

let rec ibtreeMap f tree = match tree with (Leaf n) \rightarrow Leaf (f n) | Node (left_tree, right_tree) -> Node (ibtreeMap f left_tree, ibtreeMap f right tree);; val ibtreeMap : (int -> int) -> int_Bin_Tree -> int Bin Tree = <fun>

ibtreeMap ((+) 2) bin_tree;;

- : int_Bin_Tree = Node (Node (Leaf 5, Leaf 8), Leaf (-5))

Folding over Recursive Types

let rec ibtreeFoldRight leafFun nodeFun tree = match tree with Leaf $n \rightarrow \text{leafFun}$ Node (left_tree, right_tree) -> nodeFun (ibtreeFoldRight leafFun nodeFun left_tree) (ibtreeFoldRight leafFun nodeFun right tree);; val ibtreeFoldRight : (int -> 'a) -> ('a -> 'a -> 'a) ->int Bin Tree -> 'a = <fun>

Folding over Recursive Types

let tree_sum =

ibtreeFoldRight (fun x -> x) (+);;

val tree_sum : int_Bin_Tree -> int = <fun>

- # tree_sum bin_tree;;
- : int = 2
