

Programming Languages and Compilers (CS 421)

Elsa L Gunter
2112 SC, UIUC

<http://courses.engr.illinois.edu/cs421>

Based in part on slides by Mattox Beckman, as updated by Vikram Adve and Gul Agha

10/13/16

1

Example

- x, y, z variables, f, g constructors

- Unify $\{(f(x) = f(g(f(z), y))), (g(y, y) = x)\} = ?$

10/13/16

2

Example

- x, y, z variables, f, g constructors
- $S = \{(f(x) = f(g(f(z), y))), (g(y, y) = x)\}$ is nonempty
- Unify $\{(f(x) = f(g(f(z), y))), (g(y, y) = x)\} = ?$

10/13/16

3

Example

- x, y, z variables, f, g constructors
- Pick a pair: $(g(y, y) = x)$
- Unify $\{(f(x) = f(g(f(z), y))), (g(y, y) = x)\} = ?$

10/13/16

4

Example

- x, y, z variables, f, g constructors
- Pick a pair: $(g(y, y) = x)$
- Orient: $(x = g(y, y))$
- Unify $\{(f(x) = f(g(f(z), y))), (g(y, y) = x)\} =$
Unify $\{(f(x) = f(g(f(z), y))), (x = g(y, y))\}$
by Orient

10/13/16

5

Example

- x, y, z variables, f, g constructors
- Unify $\{(f(x) = f(g(f(z), y))), (x = g(y, y))\} = ?$

10/13/16

6

Example

- x, y, z variables, f, g constructors
- $\{(f(x) = f(g(f(z), y))), (x = g(y, y))\}$ is non-empty
- Unify $\{(f(x) = f(g(f(z), y))), (x = g(y, y))\} = ?$

10/13/16

7

Example

- x, y, z variables, f, g constructors
- Pick a pair: $(x = g(y, y))$
- Unify $\{(f(x) = f(g(f(z), y))), (x = g(y, y))\} = ?$

10/13/16

8

Example

- x, y, z variables, f, g constructors
- Pick a pair: $(x = g(y, y))$
- Eliminate x with substitution $\{x \rightarrow g(y, y)\}$
 - Check: x not in $g(y, y)$
- Unify $\{(f(x) = f(g(f(z), y))), (x = g(y, y))\} = ?$

10/13/16

9

Example

- x, y, z variables, f, g constructors
- Pick a pair: $(x = g(y, y))$
- Eliminate x with substitution $\{x \rightarrow g(y, y)\}$
- Unify $\{(f(x) = f(g(f(z), y))), (x = g(y, y))\} =$
Unify $\{(f(g(y, y)) = f(g(f(z), y)))\}$
 - $\{x \rightarrow g(y, y)\}$

10/13/16

10

Example

- x, y, z variables, f, g constructors
- Unify $\{(f(g(y, y)) = f(g(f(z), y)))\}$
 - $\{x \rightarrow g(y, y)\} = ?$

10/13/16

11

Example

- x, y, z variables, f, g constructors
- $\{(f(g(y, y)) = f(g(f(z), y)))\}$ is non-empty
- Unify $\{(f(g(y, y)) = f(g(f(z), y)))\}$
 - $\{x \rightarrow g(y, y)\} = ?$

10/13/16

12

Example

- x, y, z variables, f, g constructors
- Pick a pair: $(f(g(y, y)) = f(g(f(z), y)))$

- Unify $\{(f(g(y, y)) = f(g(f(z), y)))\}$
 - $\{x \rightarrow g(y, y)\} = ?$

10/13/16

13

Example

- x, y, z variables, f, g constructors
- Pick a pair: $(f(g(y, y)) = f(g(f(z), y)))$
- Decompose: $(f(g(y, y)) = f(g(f(z), y)))$ becomes $\{(g(y, y) = g(f(z), y))\}$

- Unify $\{(f(g(y, y)) = f(g(f(z), y)))\}$
 - $\{x \rightarrow g(y, y)\} =$
 - Unify $\{(g(y, y) = g(f(z), y))\} \circ \{x \rightarrow g(y, y)\}$

10/13/16

14

Example

- x, y, z variables, f, g constructors
- $\{(g(y, y) = g(f(z), y))\}$ is non-empty

- Unify $\{(g(y, y) = g(f(z), y))\}$
 - $\{x \rightarrow g(y, y)\} = ?$

10/13/16

15

Example

- x, y, z variables, f, g constructors
- Pick a pair: $(g(y, y) = g(f(z), y))$

- Unify $\{(g(y, y) = g(f(z), y))\}$
 - $\{x \rightarrow g(y, y)\} = ?$

10/13/16

16

Example

- x, y, z variables, f, g constructors
- Pick a pair: $(f(g(y, y)) = f(g(f(z), y)))$
- Decompose: $(g(y, y) = g(f(z), y))$ becomes $\{(y = f(z)); (y = y)\}$

- Unify $\{(g(y, y) = g(f(z), y))\} \circ \{x \rightarrow g(y, y)\} =$
Unify $\{(y = f(z)); (y = y)\} \circ \{x \rightarrow g(y, y)\}$

10/13/16

17

Example

- x, y, z variables, f, g constructors

- Unify $\{(y = f(z)); (y = y)\} \circ \{x \rightarrow g(y, y)\} = ?$

10/13/16

18

Example

- x, y, z variables, f, g constructors
- $\{(y = f(z)); (y = y)\} \circ \{x \rightarrow g(y, y)\}$ is non-empty
- Unify $\{(y = f(z)); (y = y)\} \circ \{x \rightarrow g(y, y)\} = ?$

10/13/16

19

Example

- x, y, z variables, f, g constructors
- Pick a pair: $(y = f(z))$
- Unify $\{(y = f(z)); (y = y)\} \circ \{x \rightarrow g(y, y)\} = ?$

10/13/16

20

Example

- x, y, z variables, f, g constructors
- Pick a pair: $(y = f(z))$
- Eliminate y with $\{y \rightarrow f(z)\}$
- Unify $\{(y = f(z)); (y = y)\} \circ \{x \rightarrow g(y, y)\} =$
Unify $\{(f(z) = f(z))\}$
o $\{y \rightarrow f(z)\} \circ \{x \rightarrow g(y, y)\} =$
Unify $\{(f(z) = f(z))\}$
o $\{y \rightarrow f(z); x \rightarrow g(f(z), f(z))\}$

10/13/16

21

Example

- x, y, z variables, f, g constructors
- Unify $\{(f(z) = f(z))\}$
o $\{y \rightarrow f(z); x \rightarrow g(f(z), f(z))\} = ?$

10/13/16

22

Example

- x, y, z variables, f, g constructors
- $\{(f(z) = f(z))\}$ is non-empty
- Unify $\{(f(z) = f(z))\}$
o $\{y \rightarrow f(z); x \rightarrow g(f(z), f(z))\} = ?$

10/13/16

23

Example

- x, y, z variables, f, g constructors
- Pick a pair: $(f(z) = f(z))$
- Unify $\{(f(z) = f(z))\}$
o $\{y \rightarrow f(z); x \rightarrow g(f(z), f(z))\} = ?$

10/13/16

24

Example

- x, y, z variables, f, g constructors
 - Pick a pair: $(f(z) = f(z))$
 - Delete
 - Unify $\{(f(z) = f(z))\}$
 - $\{y \rightarrow f(z); x \rightarrow g(f(z), f(z))\} =$
- Unify $\{\}$ o $\{y \rightarrow f(z); x \rightarrow g(f(z), f(z))\}$

10/13/16

25

Example

- x, y, z variables, f, g constructors
- Unify $\{\}$ o $\{y \rightarrow f(z); x \rightarrow g(f(z), f(z))\} = ?$

10/13/16

26

Example

- x, y, z variables, f, g constructors
- $\{\}$ is empty
- Unify $\{\}$ = identity function
- Unify $\{\}$ o $\{y \rightarrow f(z); x \rightarrow g(f(z), f(z))\} =$
 $\{y \rightarrow f(z); x \rightarrow g(f(z), f(z))\}$

10/13/16

27

Example

- Unify $\{(f(x) = f(g(f(z), y))), (g(y, y) = x)\} =$
 $\{y \rightarrow f(z); x \rightarrow g(f(z), f(z))\}$

$$f(x) = f(g(f(z), y)) \rightarrow f(g(f(z), f(z))) = f(g(f(z), f(z)))$$

$$g(y, y) = x \rightarrow g(f(z), f(z)) = g(f(z), f(z))$$

10/13/16

28

Example of Failure: Decompose

- Unify $\{(f(x, g(y)) = f(h(y), x))\}$
- Decompose: $(f(x, g(y)) = f(h(y), x))$
- = Unify $\{(x = h(y)), (g(y) = x)\}$
- Orient: $(g(y) = x)$
- = Unify $\{(x = h(y)), (x = g(y))\}$
- Eliminate: $(x = h(y))$
- Unify $\{(h(y), g(y))\}$ o $\{x \rightarrow h(y)\}$
- No rule to apply! Decompose fails!

10/13/16

29

Example of Failure: Occurs Check

- Unify $\{(f(x, g(x)) = f(h(x), x))\}$
- Decompose: $(f(x, g(x)) = f(h(x), x))$
- = Unify $\{(x = h(x)), (g(x) = x)\}$
- Orient: $(g(x) = x)$
- = Unify $\{(x = h(x)), (x = g(x))\}$
- No rules apply.

10/13/16

30

Programming Languages & Compilers

Three Main Topics of the Course

10/13/16

31

Programming Languages & Compilers

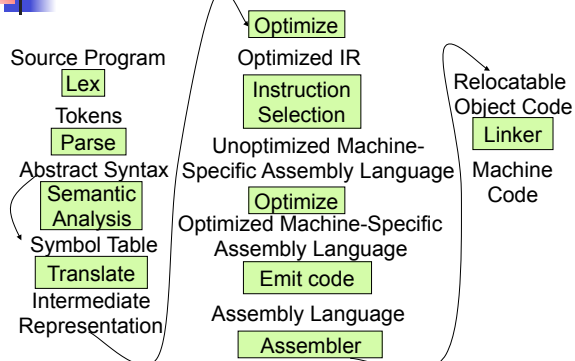

II : Language Translation

10/13/16

32

Major Phases of a Compiler

Modified from "Modern Compiler Implementation in ML", by Andrew Appel

Where We Are Going Next?

- We want to turn strings (code) into computer instructions
- Done in phases
- Turn strings into abstract syntax trees (parse)
- Translate abstract syntax trees into executable instructions (interpret or compile)

10/13/16

34

Meta-discourse

- Language Syntax and Semantics
- Syntax
 - Regular Expressions, DFSAs and NDFSAs
 - Grammars
- Semantics
 - Natural Semantics
 - Transition Semantics

10/13/16

35

Language Syntax

- Syntax is the description of which strings of symbols are meaningful expressions in a language
- It takes more than syntax to understand a language; need meaning (semantics) too
- Syntax is the entry point

10/13/16

36

Syntax of English Language

- Pattern 1

Subject	Verb
David	sings
The dog	barked
Susan	yawned

- Pattern 2

Subject	Verb	Direct Object
David	sings	ballads
The professor	wants	to retire
The jury	found	the defendant guilty

10/13/16

37

Elements of Syntax

- Character set – previously always ASCII, now often 64 character sets
- Keywords – usually reserved
- Special constants – cannot be assigned to
- Identifiers – can be assigned to
- Operator symbols
- Delimiters (parenthesis, braces, brackets)
- Blanks (aka white space)

10/13/16

38

Elements of Syntax

- Expressions
if ... then begin ... ; ... end else begin ... ; ... end
- Type expressions
 $type_{expr_1} \rightarrow type_{expr_2}$
- Declarations (in functional languages)
let *pattern* = *expr*
- Statements (in imperative languages)
 $a = b + c$
- Subprograms
let *pattern*₁ = *expr*₁ in *expr*

10/13/16

39

Elements of Syntax

- Modules
- Interfaces
- Classes (for object-oriented languages)

10/13/16

40

Lexing and Parsing

- Converting strings to abstract syntax trees done in two phases
 - **Lexing:** Converting string (or streams of characters) into lists (or streams) of tokens (the “words” of the language)
 - Specification Technique: Regular Expressions
 - **Parsing:** Convert a list of tokens into an abstract syntax tree
 - Specification Technique: BNF Grammars

10/13/16

41

Formal Language Descriptions

- Regular expressions, regular grammars, finite state automata
- Context-free grammars, BNF grammars, syntax diagrams
- Whole family more of grammars and automata – covered in automata theory

10/13/16

42

Grammars

- Grammars are formal descriptions of which strings over a given character set are in a particular language
- Language designers write grammar
- Language implementers use grammar to know what programs to accept
- Language users use grammar to know how to write legitimate programs

10/13/16

43

Regular Expressions - Review

- Start with a given character set – **a, b, c...**
- Each character is a regular expression
 - It represents the set of one string containing just that character

10/13/16

44

Regular Expressions

- If **x** and **y** are regular expressions, then **xy** is a regular expression
 - It represents the set of all strings made from first a string described by **x** then a string described by **y**
 - If **x** and **y** are regular expressions, then **xvy** is a regular expression
 - It represents the set of strings described by either **x** or **y**
- If $x = \{a, ab\}$ and $y = \{c, d\}$ then $xy = \{ac, ad, abc, abd\}$.
- If $x = \{a, ab\}$ and $y = \{c, d\}$ then $x \vee y = \{a, ab, c, d\}$

10/13/16

45

Regular Expressions

- If **x** is a regular expression, then so is **(x)**
 - It represents the same thing as **x**
 - If **x** is a regular expression, then so is **x***
 - It represents strings made from concatenating zero or more strings from **x**
 - ϵ
 - It represents $\{\epsilon\}$, set containing the empty string
 - \emptyset
 - It represents $\{\}$, the empty set
- If $x = \{a, ab\}$ then $x^* = \{\epsilon, a, ab, aa, aab, abab, \dots\}$

10/13/16

46

Example Regular Expressions

- **(0v1)*1**
 - The set of all strings of **0**'s and **1**'s ending in **1**, $\{1, 01, 11, \dots\}$
- **a*b(a*)**
 - The set of all strings of **a**'s and **b**'s with exactly one **b**
- **((01) v (10))***
 - You tell me
- Regular expressions (equivalently, regular grammars) important for lexing, breaking strings into recognized words

10/13/16

47

Regular Grammars

- Subclass of BNF (covered in detail soon)
- Only rules of form $\langle \text{nonterminal} \rangle ::= \langle \text{terminal} \rangle \langle \text{nonterminal} \rangle$ or $\langle \text{nonterminal} \rangle ::= \langle \text{terminal} \rangle$ or $\langle \text{nonterminal} \rangle ::= \epsilon$
- Defines same class of languages as regular expressions
- Important for writing lexers (programs that convert strings of characters into strings of tokens)
- Close connection to nondeterministic finite state automata – nonterminals \cong states; rule \cong edge

10/13/16

48

Example

- Regular grammar:
 - $\langle \text{Balanced} \rangle ::= \epsilon$
 - $\langle \text{Balanced} \rangle ::= 0 \langle \text{OneAndMore} \rangle$
 - $\langle \text{Balanced} \rangle ::= 1 \langle \text{ZeroAndMore} \rangle$
 - $\langle \text{OneAndMore} \rangle ::= 1 \langle \text{Balanced} \rangle$
 - $\langle \text{ZeroAndMore} \rangle ::= 0 \langle \text{Balanced} \rangle$
- Generates even length strings where every initial substring of even length has same number of 0's as 1's

10/13/16

49

Example: Lexing

- Regular expressions good for describing lexemes (words) in a programming language
 - Identifier = $(a \vee b \vee \dots \vee z \vee A \vee B \vee \dots \vee Z) (a \vee b \vee \dots \vee z \vee A \vee B \vee \dots \vee Z \vee 0 \vee 1 \vee \dots \vee 9)^*$
 - Digit = $(0 \vee 1 \vee \dots \vee 9)$
 - Number = $0 \vee (1 \vee \dots \vee 9)(0 \vee \dots \vee 9)^* \vee \sim (1 \vee \dots \vee 9)(0 \vee \dots \vee 9)^*$
 - Keywords: if = if, while = while,...

10/13/16

50

Implementing Regular Expressions

- Regular expressions reasonable way to generate strings in language
- Not so good for recognizing when a string is in language
- Problems with Regular Expressions
 - which option to choose,
 - how many repetitions to make
- Answer: finite state automata
- Should have seen in CS373 / CS374

10/13/16

51

Lexing

- Different syntactic categories of "words": tokens
- Example:
- Convert sequence of characters into sequence of strings, integers, and floating point numbers.
 - "asd 123 jkl 3.14" will become:
[String "asd"; Int 123; String "jkl"; Float 3.14]

10/13/16

52

Lex, ocamllex

- Could write the reg exp, then translate to DFA by hand
 - A lot of work
- Better: Write program to take reg exp as input and automatically generates automata
- Lex is such a program
- ocamllex version for ocaml

10/13/16

53

How to do it

- To use regular expressions to parse our input we need:
 - Some way to identify the input string — call it a lexing buffer
 - Set of regular expressions,
 - Corresponding set of actions to take when they are matched.

10/13/16

54

How to do it

- The lexer will take the regular expressions and generate a state machine.
- The state machine will take our lexing buffer and apply the transitions...
- If we reach an accepting state from which we can go no further, the machine will perform the appropriate action.

10/13/16

55

Mechanics

- Put table of reg exp and corresponding actions (written in ocaml) into a file `<filename>.mll`
- Call

```
ocamllex <filename>.mll
```
- Produces Ocaml code for a lexical analyzer in file `<filename>.ml`

10/13/16

56

Sample Input

```
rule main = parse
  ['0'-'9']+ { print_string "Int\n"}
  | ['0'-'9']+ '.' ['0'-'9']+ { print_string "Float\n"}
  | ['a'-'z']+ { print_string "String\n"}
  | _ { main lexbuf }
{
  let newlexbuf = (Lexing.from_channel stdin) in
  print_string "Ready to lex.\n";
  main newlexbuf
}
```

10/13/16

57

General Input

```
{ header }
let ident = regexp ...
rule entrypoint [arg1... argn] = parse
  regexp { action }
  | ...
  | regexp { action }
and entrypoint [arg1... argn] =
  parse ...and ...
{ trailer }
```

10/13/16

58

Ocamllex Input

- *header* and *trailer* contain arbitrary ocaml code put at top and bottom of `<filename>.ml`
- `let ident = regexp ...` Introduces *ident* for use in later regular expressions

10/13/16

59

Ocamllex Input

- `<filename>.ml` contains one lexing function per *entrypoint*
 - Name of function is name given for *entrypoint*
 - Each entry point becomes an Ocaml function that takes $n+1$ arguments, the extra implicit last argument being of type `Lexing.lexbuf`
- `arg1... argn` are for use in *action*

10/13/16

60

Ocamlex Regular Expression

- Single quoted characters for letters: `'a'`
- `_`: (underscore) matches any letter
- `Eof`: special "end_of_file" marker
- Concatenation same as usual
- `"string"`: concatenation of sequence of characters
- `e1 / e2`: choice - what was `e1 ∨ e2`

10/13/16

61

Ocamlex Regular Expression

- `[c1 - c2]`: choice of any character between first and second inclusive, as determined by character codes
- `[^c1 - c2]`: choice of any character NOT in set
- `e*`: same as before
- `e+`: same as `e e*`
- `e?`: option - was `e1 ∨ ε`

10/13/16

62

Ocamlex Regular Expression

- `e1 # e2`: the characters in `e1` but not in `e2`; `e1` and `e2` must describe just sets of characters
- `ident`: abbreviation for earlier reg exp in `let ident = regexp`
- `e1 as id`: binds the result of `e1` to `id` to be used in the associated `action`

10/13/16

63

Ocamlex Manual

- More details can be found at

<http://caml.inria.fr/pub/docs/manual-ocaml/lexyacc.html>

10/13/16

64

Example : test.mll

```
{ type result = Int of int | Float of float |
  String of string }
let digit = ['0'-'9']
let digits = digit +
let lower_case = ['a'-'z']
let upper_case = ['A'-'Z']
let letter = upper_case | lower_case
let letters = letter +
```

10/13/16

65

Example : test.mll

```
rule main = parse
  (digits)'.'digits as f { Float (float_of_string f) }
  | digits as n          { Int (int_of_string n) }
  | letters as s         { String s }
  | _ { main lexbuf }
{ let newlexbuf = (Lexing.from_channel stdin) in
  print_string "Ready to lex.";
  print_newline ();
  main newlexbuf }
```

10/13/16

66

Example

```
# #use "test.ml";;
...
val main : Lexing.lexbuf -> result = <fun>
val __ocaml_lex_main_rec : Lexing.lexbuf -> int ->
  result = <fun>
Ready to lex.
hi there 234 5.2
- : result = String "hi"
What happened to the rest?!?
```

10/13/16

67

Example

```
# let b = Lexing.from_channel stdin;;
# main b;;
hi 673 there
- : result = String "hi"
# main b;;
- : result = Int 673
# main b;;
- : result = String "there"
```

10/13/16

68

Problem

- How to get lexer to look at more than the first token at one time?
- Answer: *action* has to tell it to -- recursive calls
- Side Benefit: can add “state” into lexing
- Note: already used this with the `_ case`

10/13/16

69

Example

```
rule main = parse
  (digits) '.' digits as f { Float (float_of_string f) :: main lexbuf }
  | digits as n          { Int (int_of_string n) :: main lexbuf }
  | letters as s         { String s :: main lexbuf }
  | eof                  { [] }
  | _                    { main lexbuf }
```

10/13/16

70

Example Results

```
Ready to lex.
hi there 234 5.2
- : result list = [String "hi"; String "there"; Int 234; Float 5.2]
#
```

Used Ctrl-d to send the end-of-file signal

10/13/16

71

Dealing with comments

First Attempt

```
let open_comment = "("
let close_comment = ")"
rule main = parse
  (digits) '.' digits as f { Float (float_of_string f) :: main lexbuf }
  | digits as n          { Int (int_of_string n) :: main lexbuf }
  | letters as s         { String s :: main lexbuf }
```

10/13/16

72

Dealing with comments

```
| open_comment    { comment lexbuf }
| eof             { [] }
| _ { main lexbuf }
and comment = parse
  close_comment   { main lexbuf }
| _              { comment lexbuf }
```

10/13/16

73

Dealing with nested comments

```
rule main = parse ...
| open_comment    { comment 1 lexbuf }
| eof             { [] }
| _ { main lexbuf }
and comment depth = parse
  open_comment    { comment (depth+1)
lexbuf }
| close_comment   { if depth = 1
                    then main lexbuf
                    else comment (depth - 1) lexbuf }
| _              { comment depth lexbuf }
```

10/13/16

74

Dealing with nested comments

```
rule main = parse
  (digits) ':' digits as f { Float (float_of_string f) ::
main lexbuf }
| digits as n           { Int (int_of_string n) :: main
lexbuf }
| letters as s          { String s :: main lexbuf }
| open_comment          { (comment 1 lexbuf }
| eof                   { [] }
| _ { main lexbuf }
```

10/13/16

75

Dealing with nested comments

```
and comment depth = parse
  open_comment    { comment (depth+1) lexbuf }
| close_comment   { if depth = 1
                    then main lexbuf
                    else comment (depth - 1) lexbuf }
| _              { comment depth lexbuf }
```

10/13/16

76
