Based in part on slides by Mattox Beckman, as updated by Vikram Adve and Gul Agha

# Lambda Calculus - Motivation

---

- Aim is to capture the essence of functions, function applications, and evaluation
- $\lambda$ -calculus is a theory of computation
- “The Lambda Calculus: Its Syntax and Semantics”. H. P. Barendregt. North Holland, 1984

# Lambda Calculus - Motivation

---

- All *sequential programs* may be viewed as functions from input (initial state and input values) to output (resulting state and output values).
- $\lambda$ -calculus is a mathematical formalism of functions and functional computations
- Two flavors: typed and untyped

# Untyped $\lambda$ -Calculus

---

- Only three kinds of expressions:
  - Variables:  $x, y, z, w, \dots$
  - Abstraction:  $\lambda x. e$   
(Function creation, think `fun x -> e`)
  - Application:  $e_1 e_2$

# Untyped $\lambda$ -Calculus Grammar

---

- Formal BNF Grammar:

- $\langle \text{expression} \rangle ::= \langle \text{variable} \rangle$

- |  $\langle \text{abstraction} \rangle$

- |  $\langle \text{application} \rangle$

- |  $(\langle \text{expression} \rangle)$

- $\langle \text{abstraction} \rangle$

- $::= \lambda \langle \text{variable} \rangle . \langle \text{expression} \rangle$

- $\langle \text{application} \rangle$

- $::= \langle \text{expression} \rangle \langle \text{expression} \rangle$

# Untyped $\lambda$ -Calculus Terminology

---

- **Occurrence**: a location of a subterm in a term
- **Variable binding**:  $\lambda x. e$  is a binding of  $x$  in  $e$
- **Bound occurrence**: all occurrences of  $x$  in  $\lambda x. e$
- **Free occurrence**: one that is not bound
- **Scope of binding**: in  $\lambda x. e$ , all occurrences in  $e$  not in a subterm of the form  $\lambda x. e'$  (same  $x$ )
- **Free variables**: all variables having free occurrences in a term

# Example

---

- Label occurrences and scope:

$(\lambda x. y \lambda y. y (\lambda x. x y) x) x$   
1 2 3 4 5 6 7 8 9

# Example

- Label occurrences and scope:

# Untyped $\lambda$ -Calculus

---

- How do you compute with the  $\lambda$ -calculus?
- Roughly speaking, by substitution:
- $(\lambda x. e_1) e_2 \Rightarrow^* e_1 [e_2 / x]$
- \* Modulo all kinds of subtleties to avoid free variable capture

# Transition Semantics for $\lambda$ -Calculus

---

$$\frac{E \rightarrow E''}{EE' \twoheadrightarrow E''E'}$$

- Application (version 1 - Lazy Evaluation)

$$(\lambda x . E) E' \twoheadrightarrow E[E'/x]$$

- Application (version 2 - Eager Evaluation)

$$\frac{E' \twoheadrightarrow E''}{(\lambda x . E) E' \twoheadrightarrow (\lambda x . E) E''}$$

$$\frac{}{(\lambda x . E) V \twoheadrightarrow E[V/x]}$$

$V$  - variable or abstraction (value)

# How Powerful is the Untyped $\lambda$ -Calculus?

---

- The untyped  $\lambda$ -calculus is Turing Complete
  - Can express any sequential computation
- Problems:
  - How to express basic data: booleans, integers, etc?
  - How to express recursion?
  - Constants, `if_then_else`, etc, are conveniences; can be added as syntactic sugar

# Typed vs Untyped $\lambda$ -Calculus

---

- The *pure*  $\lambda$ -calculus has no notion of type:  $(f f)$  is a legal expression
- Types restrict which applications are valid
- Types are not syntactic sugar! They disallow some terms
- Simply typed  $\lambda$ -calculus is less powerful than the untyped  $\lambda$ -Calculus: NOT Turing Complete (no recursion)

## Uses of $\lambda$ -Calculus

---

- Typed and untyped  $\lambda$ -calculus used for theoretical study of sequential programming languages
- Sequential programming languages are essentially the  $\lambda$ -calculus, extended with predefined constructs, constants, types, and syntactic sugar

- Ocaml is close to the  $\lambda$ -Calculus:

$$\text{fun } x \text{ -> exp } \text{ --> } \lambda x. \text{ exp}$$
$$\text{let } x = e_1 \text{ in } e_2 \text{ --> } (\lambda x. e_2)e_1$$

# $\alpha$ Conversion

---

- $\alpha$ -conversion:

$\lambda x. \text{exp} \xrightarrow{\alpha} \lambda y. (\text{exp} [y/x])$

- Provided that

1.  $y$  is not free in  $\text{exp}$
2. No free occurrence of  $x$  in  $\text{exp}$  becomes bound in  $\text{exp}$  when replaced by  $y$

# $\alpha$ Conversion Non-Examples

---

1. Error:  $y$  is not free in termsecond

$$\lambda x. x y \not\rightarrow_{\alpha} \lambda y. y y$$

2. Error: free occurrence of  $x$  becomes bound in wrong way when replaced by  $y$

$$\lambda x. \underbrace{\lambda y. x y}_{\text{exp}} \not\rightarrow_{\alpha} \lambda y. \underbrace{\lambda y. y y}_{\text{exp}[y/x]}$$

But  $\lambda x. (\lambda y. y) x \rightarrow_{\alpha} \lambda y. (\lambda y. y) y$

And  $\lambda y. (\lambda y. y) y \rightarrow_{\alpha} \lambda x. (\lambda y. y) x$

# Congruence

---

- Let  $\sim$  be a relation on lambda terms.  $\sim$  is a **congruence** if
- it is an equivalence relation
- If  $e_1 \sim e_2$  then
  - $(e e_1) \sim (e e_2)$  and  $(e_1 e) \sim (e_2 e)$
  - $\lambda x. e_1 \sim \lambda x. e_2$

## $\alpha$ Equivalence

---

- $\alpha$  equivalence is the smallest congruence containing  $\alpha$  conversion
- One usually treats  $\alpha$ -equivalent terms as equal - i.e. use  $\alpha$  equivalence classes of terms

## Example

---

Show:  $\lambda x. (\lambda y. y x) x \sim_{\alpha} \lambda y. (\lambda x. x y) y$

- $\lambda x. (\lambda y. y x) x \rightarrow_{\alpha} \lambda z. (\lambda y. y z) z$  SO  
 $\lambda x. (\lambda y. y x) x \sim_{\alpha} \lambda z. (\lambda y. y z) z$
- $(\lambda y. y z) \rightarrow_{\alpha} (\lambda x. x z)$  SO  
 $(\lambda y. y z) \sim_{\alpha} (\lambda x. x z)$  SO  
 $\lambda z. (\lambda y. y z) z \sim_{\alpha} \lambda z. (\lambda x. x z) z$
- $\lambda z. (\lambda x. x z) z \rightarrow_{\alpha} \lambda y. (\lambda x. x y) y$  SO  
 $\lambda z. (\lambda x. x z) z \sim_{\alpha} \lambda y. (\lambda x. x y) y$
- $\lambda x. (\lambda y. y x) x \sim_{\alpha} \lambda y. (\lambda x. x y) y$

# Substitution

---

- Defined on  $\alpha$ -equivalence classes of terms
- $P [N / x]$  means replace every free occurrence of  $x$  in  $P$  by  $N$ 
  - $P$  called *redex*;  $N$  called *residue*
- Provided that no variable free in  $P$  becomes bound in  $P [N / x]$ 
  - Rename bound variables in  $P$  to avoid capturing free variables of  $N$

# Substitution

---

- $x [N / x] = N$
- $y [N / x] = y$  if  $y \neq x$
- $(e_1 e_2) [N / x] = ((e_1 [N / x]) (e_2 [N / x]))$
- $(\lambda x. e) [N / x] = (\lambda x. e)$
- $(\lambda y. e) [N / x] = \lambda y. (e [N / x])$   
provided  $y \neq x$  and  $y$  not free in  $N$ 
  - Rename  $y$  in redex if necessary

## Example

---

$$(\lambda y. y z) [(\lambda x. x y) / z] = ?$$

- Problems?

- $z$  in redex in scope of  $y$  binding
- $y$  free in the residue

- $(\lambda y. y z) [(\lambda x. x y) / z] \xrightarrow{\alpha} (\lambda w. w z) [(\lambda x. x y) / z] = \lambda w. w (\lambda x. x y)$

# Example

---

- Only replace free occurrences
- $(\lambda y. y z (\lambda z. z)) [(\lambda x. x) / z] =$   
 $\lambda y. y (\lambda x. x) (\lambda z. z)$

Not

$$\lambda y. y (\lambda x. x) (\lambda z. (\lambda x. x))$$

## $\beta$ reduction

---

- $\beta$  Rule:  $(\lambda x. P) N \xrightarrow{\beta} P [N / x]$
- Essence of computation in the lambda calculus
- Usually defined on  $\alpha$ -equivalence classes of terms

## Example

---

- $(\lambda z. (\lambda x. x y) z) (\lambda y. y z)$

- $--\beta--> (\lambda x. x y) (\lambda y. y z)$

- $--\beta--> (\lambda y. y z) y --\beta--> y z$

- $(\lambda x. x x) (\lambda x. x x)$

- $--\beta--> (\lambda x. x x) (\lambda x. x x)$

- $--\beta--> (\lambda x. x x) (\lambda x. x x) --\beta--> \dots$

# $\alpha$ $\beta$ Equivalence

---

- $\alpha$   $\beta$  equivalence is the smallest congruence containing  $\alpha$  equivalence and  $\beta$  reduction
- A term is in *normal form* if no subterm is  $\alpha$  equivalent to a term that can be  $\beta$  reduced
- Hard fact (Church-Rosser): if  $e_1$  and  $e_2$  are  $\alpha\beta$ -equivalent and both are normal forms, then they are  $\alpha$  equivalent

# Order of Evaluation

---

- Not all terms reduce to normal forms
- Not all reduction strategies will produce a normal form if one exists

## Lazy evaluation:

---

- Always reduce the left-most application in a top-most series of applications (i.e. Do not perform reduction inside an abstraction)
- Stop when term is not an application, or left-most application is not an application of an abstraction to a term

## Example 1

---

- $(\lambda z. (\lambda x. x)) ((\lambda y. y y) (\lambda y. y y))$
- Lazy evaluation:
- Reduce the left-most application:
- $(\lambda z. (\lambda x. x)) ((\lambda y. y y) (\lambda y. y y))$   
 $\rightarrow (\lambda x. x)$

# Eager evaluation

---

- (Eagerly) reduce left of top application to an abstraction
- Then (eagerly) reduce argument
- Then  $\beta$ -reduce the application

## Example 1

---

- $(\lambda z. (\lambda x. x))((\lambda y. y y) (\lambda y. y y))$
- Eager evaluation:
- Reduce the rator of the top-most application to an abstraction: Done.
- Reduce the argument:
- $(\lambda z. (\lambda x. x))((\lambda y. y y) (\lambda y. y y))$
- $\beta$ -->  $(\lambda z. (\lambda x. x))((\lambda y. y y) (\lambda y. y y))$
- $\beta$ -->  $(\lambda z. (\lambda x. x))((\lambda y. y y) (\lambda y. y y))...$

## Example 2

---

- $(\lambda x. x x)((\lambda y. y y) (\lambda z. z))$
- Lazy evaluation:

$(\lambda x. x x)((\lambda y. y y) (\lambda z. z)) \xrightarrow{\beta}$

## Example 2

---

- $(\lambda x. x x)((\lambda y. y y) (\lambda z. z))$
- Lazy evaluation:

$(\lambda x. \boxed{x} \boxed{x}) \underline{((\lambda y. y y) (\lambda z. z))} \xrightarrow{\beta}$

## Example 2

---

- $(\lambda x. x x)((\lambda y. y y) (\lambda z. z))$
- Lazy evaluation:

$(\lambda x. \boxed{x} \boxed{x})((\lambda y. y y) (\lambda z. z)) \xrightarrow{\beta}$

$\boxed{((\lambda y. y y) (\lambda z. z))} \boxed{((\lambda y. y y) (\lambda z. z))}$

## Example 2

---

- $(\lambda x. x x)((\lambda y. y y) (\lambda z. z))$
- Lazy evaluation:

$(\lambda x. x x)((\lambda y. y y) (\lambda z. z)) \xrightarrow{\beta}$

$((\lambda y. y y) (\lambda z. z)) ((\lambda y. y y) (\lambda z. z))$

## Example 2

---

- $(\lambda x. x x)((\lambda y. y y) (\lambda z. z))$

- Lazy evaluation:

$(\lambda x. x x)((\lambda y. y y) (\lambda z. z)) \xrightarrow{\beta}$

$((\lambda y. \boxed{y} \boxed{y}) \underline{(\lambda z. z)}) ((\lambda y. y y) (\lambda z. z))$

## Example 2

---

- $(\lambda x. x x)((\lambda y. y y) (\lambda z. z))$

- Lazy evaluation:

$(\lambda x. x x)((\lambda y. y y) (\lambda z. z)) \xrightarrow{\beta}$

$((\lambda y. \boxed{y} \boxed{y}) \underline{(\lambda z. z)}) ((\lambda y. y y) (\lambda z. z))$

$\xrightarrow{\beta} (\boxed{(\lambda z. z)} \boxed{(\lambda z. z)})((\lambda y. y y) (\lambda z. z))$

## Example 2

---

- $(\lambda x. x x)((\lambda y. y y) (\lambda z. z))$

- Lazy evaluation:

$(\lambda x. x x)((\lambda y. y y) (\lambda z. z)) \text{ --}\beta\text{--}\rightarrow$

$((\lambda y. y y) (\lambda z. z)) ((\lambda y. y y) (\lambda z. z))$

$\text{--}\beta\text{--}\rightarrow ((\lambda z. z) (\lambda z. z))((\lambda y. y y) (\lambda z. z))$

## Example 2

---

- $(\lambda x. x x)((\lambda y. y y) (\lambda z. z))$

- Lazy evaluation:

$(\lambda x. x x)((\lambda y. y y) (\lambda z. z)) \xrightarrow{\beta}$

$((\lambda y. y y) (\lambda z. z)) ((\lambda y. y y) (\lambda z. z))$

$\xrightarrow{\beta} ((\lambda z. \boxed{z}) \underline{(\lambda z. z)})((\lambda y. y y) (\lambda z. z))$

## Example 2

---

- $(\lambda x. x x)((\lambda y. y y) (\lambda z. z))$

- Lazy evaluation:

$(\lambda x. x x)((\lambda y. y y) (\lambda z. z)) \xrightarrow{\beta}$

$((\lambda y. y y) (\lambda z. z)) ((\lambda y. y y) (\lambda z. z))$

$\xrightarrow{\beta} ((\lambda z. \boxed{z}) (\lambda z. z)) ((\lambda y. y y) (\lambda z. z))$

$\xrightarrow{\beta} \boxed{(\lambda z. z)} ((\lambda y. y y) (\lambda z. z))$

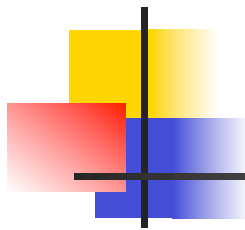

## Example 2

---

- $(\lambda x. x x)((\lambda y. y y) (\lambda z. z))$
- Lazy evaluation:

$$\begin{aligned} & (\lambda x. x x)((\lambda y. y y) (\lambda z. z)) \xrightarrow{\beta} \\ & ((\lambda y. y y) (\lambda z. z)) ((\lambda y. y y) (\lambda z. z)) \\ & \xrightarrow{\beta} ((\lambda z. z) (\lambda z. z))((\lambda y. y y) (\lambda z. z)) \\ & \xrightarrow{\beta} (\lambda z. \boxed{z}) \underline{((\lambda y. y y) (\lambda z. z))} \xrightarrow{\beta} \\ & (\lambda y. y y) (\lambda z. z) \end{aligned}$$

## Example 2

---

- $(\lambda x. x x)((\lambda y. y y) (\lambda z. z))$

- Lazy evaluation:

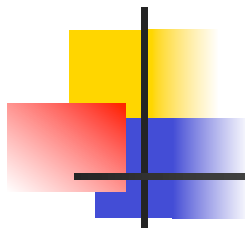

$(\lambda x. x x)((\lambda y. y y) (\lambda z. z)) \xrightarrow{\beta}$

$((\lambda y. y y) (\lambda z. z)) ((\lambda y. y y) (\lambda z. z))$

$\xrightarrow{\beta} ((\lambda z. z) (\lambda z. z)) ((\lambda y. y y) (\lambda z. z))$

$\xrightarrow{\beta} (\lambda z. z) ((\lambda y. y y) (\lambda z. z)) \xrightarrow{\beta}$

$(\lambda y. y y) (\lambda z. z)$

## Example 2

---

- $(\lambda x. x x)((\lambda y. y y) (\lambda z. z))$

- Lazy evaluation:

$(\lambda x. x x)((\lambda y. y y) (\lambda z. z)) \xrightarrow{\beta}$

$((\lambda y. y y) (\lambda z. z)) ((\lambda y. y y) (\lambda z. z))$

$\xrightarrow{\beta} ((\lambda z. z) (\lambda z. z)) ((\lambda y. y y) (\lambda z. z))$

$\xrightarrow{\beta} (\lambda z. z) ((\lambda y. y y) (\lambda z. z)) \xrightarrow{\beta}$

$(\lambda y. y y) (\lambda z. z) \sim_{\beta} \lambda z. z$

## Example 2

---

- $(\lambda x. x x)((\lambda y. y y) (\lambda z. z))$
- Eager evaluation:

$(\lambda x. x x) ((\lambda y. y y) (\lambda z. z)) \xrightarrow{\beta} (\lambda x. x x) ((\lambda z. z) (\lambda z. z)) \xrightarrow{\beta} (\lambda x. x x) (\lambda z. z) \xrightarrow{\beta} (\lambda z. z) (\lambda z. z) \xrightarrow{\beta} \lambda z. z$
