# Part I

## All Pairs Shortest Paths

# Shortest Path Problems

## Shortest Path Problems

**Input** A (undirected or directed) graph  $G = (V, E)$  with edge lengths (or costs). For edge  $e = (u, v)$ ,  $\ell(e) = \ell(u, v)$  is its length.

- 1 Given nodes  $s, t$  find shortest path from  $s$  to  $t$ .
- 2 Given node  $s$  find shortest path from  $s$  to all other nodes.
- 3 Find shortest paths for all pairs of nodes.

# Single-Source Shortest Paths

## Single-Source Shortest Path Problems

**Input** A (undirected or directed) graph  $G = (V, E)$  with edge lengths. For edge  $e = (u, v)$ ,  $\ell(e) = \ell(u, v)$  is its length.

- 1 Given nodes  $s, t$  find shortest path from  $s$  to  $t$ .
- 2 Given node  $s$  find shortest path from  $s$  to all other nodes.

**Dijkstra's algorithm** for non-negative edge lengths. Running time:  $O((m + n) \log n)$  with heaps and  $O(m + n \log n)$  with advanced priority queues.

**Bellman-Ford algorithm** for arbitrary edge lengths. Running time:  $O(nm)$ .

# Single-Source Shortest Paths

## Single-Source Shortest Path Problems

**Dijkstra's algorithm** for non-negative edge lengths. Running time:  $O((m + n) \log n)$  with heaps and  $O(m + n \log n)$  with advanced priority queues.

**Bellman-Ford algorithm** for arbitrary edge lengths. Running time:  $O(nm)$ .

# All-Pairs Shortest Paths

## All-Pairs Shortest Path Problem

**Input** A (undirected or directed) graph  $G = (V, E)$  with edge lengths. For edge  $e = (u, v)$ ,  $\ell(e) = \ell(u, v)$  is its length.

- 1 Find shortest paths for all pairs of nodes.

Apply single-source algorithms  $n$  times, once for each vertex.

- 1 Non-negative lengths.  $O(nm \log n)$  with heaps and  $O(nm + n^2 \log n)$  using advanced priority queues.
- 2 Arbitrary edge lengths:  $O(n^2m)$ .  
 $\Theta(n^4)$  if  $m = \Omega(n^2)$ .

Can we do better?

# All-Pairs Shortest Paths

## All-Pairs Shortest Path Problem

**Input** A (undirected or directed) graph  $G = (V, E)$  with edge lengths. For edge  $e = (u, v)$ ,  $\ell(e) = \ell(u, v)$  is its length.

- 1 Find shortest paths for all pairs of nodes.

Apply single-source algorithms  $n$  times, once for each vertex.

- 1 Non-negative lengths.  $O(nm \log n)$  with heaps and  $O(nm + n^2 \log n)$  using advanced priority queues.
- 2 Arbitrary edge lengths:  $O(n^2m)$ .  
 $\Theta(n^4)$  if  $m = \Omega(n^2)$ .

Can we do better?

# Shortest Paths and Recursion

- 1 Compute the shortest path distance from **s** to **t** recursively?
- 2 What are the smaller sub-problems?

## Lemma

Let  $G$  be a directed graph with arbitrary edge lengths. If  $s = v_0 \rightarrow v_1 \rightarrow v_2 \rightarrow \dots \rightarrow v_k$  is a shortest path from  $s$  to  $v_k$  then for  $1 \leq i < k$ :

- 1  $s = v_0 \rightarrow v_1 \rightarrow v_2 \rightarrow \dots \rightarrow v_i$  is a shortest path from  $s$  to  $v_i$

Sub-problem idea: paths of fewer hops/edges

# Shortest Paths and Recursion

- 1 Compute the shortest path distance from **s** to **t** recursively?
- 2 What are the smaller sub-problems?

## Lemma

Let **G** be a directed graph with arbitrary edge lengths. If  $\mathbf{s} = \mathbf{v}_0 \rightarrow \mathbf{v}_1 \rightarrow \mathbf{v}_2 \rightarrow \dots \rightarrow \mathbf{v}_k$  is a shortest path from **s** to  $\mathbf{v}_k$  then for  $1 \leq i < k$ :

- 1  $\mathbf{s} = \mathbf{v}_0 \rightarrow \mathbf{v}_1 \rightarrow \mathbf{v}_2 \rightarrow \dots \rightarrow \mathbf{v}_i$  is a shortest path from **s** to  $\mathbf{v}_i$

Sub-problem idea: paths of fewer hops/edges

# Shortest Paths and Recursion

- 1 Compute the shortest path distance from **s** to **t** recursively?
- 2 What are the smaller sub-problems?

## Lemma

Let **G** be a directed graph with arbitrary edge lengths. If  $\mathbf{s} = \mathbf{v}_0 \rightarrow \mathbf{v}_1 \rightarrow \mathbf{v}_2 \rightarrow \dots \rightarrow \mathbf{v}_k$  is a shortest path from **s** to  $\mathbf{v}_k$  then for  $1 \leq i < k$ :

- 1  $\mathbf{s} = \mathbf{v}_0 \rightarrow \mathbf{v}_1 \rightarrow \mathbf{v}_2 \rightarrow \dots \rightarrow \mathbf{v}_i$  is a shortest path from **s** to  $\mathbf{v}_i$

Sub-problem idea: paths of fewer hops/edges

# Hop-based Recur': Single-Source Shortest Paths

Single-source problem: fix source  $s$ .

**OPT**( $v, k$ ): shortest path dist. from  $s$  to  $v$  using at most  $k$  edges.

Note:  $\text{dist}(s, v) = \text{OPT}(v, n - 1)$ . Recursion for **OPT**( $v, k$ ):

$$\text{OPT}(v, k) = \min \begin{cases} \min_{u \in V} (\text{OPT}(u, k - 1) + c(u, v)) \\ \text{OPT}(v, k - 1) \end{cases}$$

Base case: **OPT**( $v, 1$ ) =  $c(s, v)$  if  $(s, v) \in E$  otherwise  $\infty$

Leads to Bellman-Ford algorithm — see text book.

**OPT**( $v, k$ ) values are also of independent interest: shortest paths with at most  $k$  hops

# Hop-based Recur': Single-Source Shortest Paths

Single-source problem: fix source  $s$ .

**OPT**( $v, k$ ): shortest path dist. from  $s$  to  $v$  using at most  $k$  edges.

Note: **dist**( $s, v$ ) = **OPT**( $v, n - 1$ ). Recursion for **OPT**( $v, k$ ):

$$\text{OPT}(v, k) = \min \begin{cases} \min_{u \in V} (\text{OPT}(u, k - 1) + c(u, v)) \\ \text{OPT}(v, k - 1) \end{cases}$$

Base case: **OPT**( $v, 1$ ) =  $c(s, v)$  if  $(s, v) \in E$  otherwise  $\infty$

Leads to Bellman-Ford algorithm — see text book.

**OPT**( $v, k$ ) values are also of independent interest: shortest paths with at most  $k$  hops

# Hop-based Recur': Single-Source Shortest Paths

Single-source problem: fix source  $s$ .

**OPT**( $v, k$ ): shortest path dist. from  $s$  to  $v$  using at most  $k$  edges.

Note: **dist**( $s, v$ ) = **OPT**( $v, n - 1$ ). Recursion for **OPT**( $v, k$ ):

$$\text{OPT}(v, k) = \min \begin{cases} \min_{u \in V} (\text{OPT}(u, k - 1) + c(u, v)) \\ \text{OPT}(v, k - 1) \end{cases}$$

Base case: **OPT**( $v, 1$ ) =  $c(s, v)$  if  $(s, v) \in E$  otherwise  $\infty$

Leads to Bellman-Ford algorithm — see text book.

**OPT**( $v, k$ ) values are also of independent interest: shortest paths with at most  $k$  hops

# Hop-based Recur': Single-Source Shortest Paths

Single-source problem: fix source  $s$ .

**OPT**( $v, k$ ): shortest path dist. from  $s$  to  $v$  using at most  $k$  edges.

Note: **dist**( $s, v$ ) = **OPT**( $v, n - 1$ ). Recursion for **OPT**( $v, k$ ):

$$\text{OPT}(v, k) = \min \begin{cases} \min_{u \in V} (\text{OPT}(u, k - 1) + c(u, v)) \\ \text{OPT}(v, k - 1) \end{cases}$$

Base case: **OPT**( $v, 1$ ) =  $c(s, v)$  if  $(s, v) \in E$  otherwise  $\infty$

Leads to Bellman-Ford algorithm — see text book.

**OPT**( $v, k$ ) values are also of independent interest: shortest paths with at most  $k$  hops

# Hop-based Recur': Single-Source Shortest Paths

Single-source problem: fix source  $s$ .

**OPT**( $v, k$ ): shortest path dist. from  $s$  to  $v$  using at most  $k$  edges.

Note: **dist**( $s, v$ ) = **OPT**( $v, n - 1$ ). Recursion for **OPT**( $v, k$ ):

$$\text{OPT}(v, k) = \min \begin{cases} \min_{u \in V} (\text{OPT}(u, k - 1) + c(u, v)) \\ \text{OPT}(v, k - 1) \end{cases}$$

Base case: **OPT**( $v, 1$ ) =  $c(s, v)$  if  $(s, v) \in E$  otherwise  $\infty$

Leads to Bellman-Ford algorithm — see text book.

**OPT**( $v, k$ ) values are also of independent interest: shortest paths with at most  $k$  hops

# Hop-based Recur': Single-Source Shortest Paths

Single-source problem: fix source  $s$ .

**OPT**( $v, k$ ): shortest path dist. from  $s$  to  $v$  using at most  $k$  edges.

Note: **dist**( $s, v$ ) = **OPT**( $v, n - 1$ ). Recursion for **OPT**( $v, k$ ):

$$\text{OPT}(v, k) = \min \begin{cases} \min_{u \in V} (\text{OPT}(u, k - 1) + c(u, v)) \\ \text{OPT}(v, k - 1) \end{cases}$$

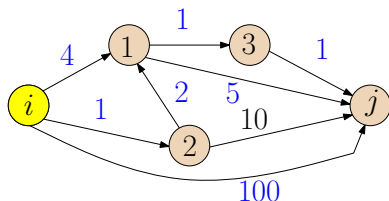

Base case: **OPT**( $v, 1$ ) =  $c(s, v)$  if  $(s, v) \in E$  otherwise  $\infty$

Leads to Bellman-Ford algorithm — see text book.

**OPT**( $v, k$ ) values are also of independent interest: shortest paths with at most  $k$  hops

# All-Pairs: Recursion on index of intermediate nodes

- 1 Number vertices arbitrarily as  $v_1, v_2, \dots, v_n$
- 2  **$\text{dist}(i, j, k)$** : shortest path distance between  $v_i$  and  $v_j$  among all paths in which the largest index of an *intermediate node* is at most  $k$

$$\text{dist}(i, j, 0) = 100$$

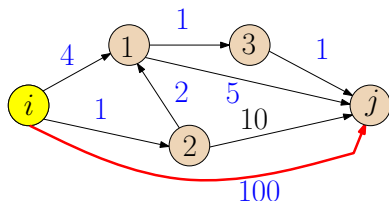

$$\text{dist}(i, j, 1) = 9$$

$$\text{dist}(i, j, 2) = 8$$

$$\text{dist}(i, j, 3) = 5$$

# All-Pairs: Recursion on index of intermediate nodes

- 1 Number vertices arbitrarily as  $v_1, v_2, \dots, v_n$
- 2  **$\text{dist}(i, j, k)$** : shortest path distance between  $v_i$  and  $v_j$  among all paths in which the largest index of an *intermediate node* is at most  $k$

$$\text{dist}(i, j, 0) = 100$$

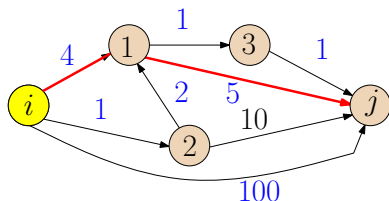

$$\text{dist}(i, j, 1) = 9$$

$$\text{dist}(i, j, 2) = 8$$

$$\text{dist}(i, j, 3) = 5$$

# All-Pairs: Recursion on index of intermediate nodes

- 1 Number vertices arbitrarily as  $v_1, v_2, \dots, v_n$
- 2  **$\text{dist}(i, j, k)$** : shortest path distance between  $v_i$  and  $v_j$  among all paths in which the largest index of an *intermediate node* is at most  $k$

$$\text{dist}(i, j, 0) = 100$$

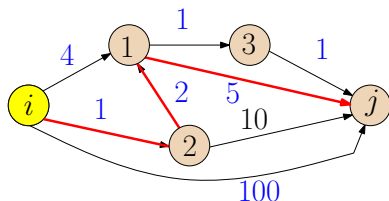

$$\text{dist}(i, j, 1) = 9$$

$$\text{dist}(i, j, 2) = 8$$

$$\text{dist}(i, j, 3) = 5$$

# All-Pairs: Recursion on index of intermediate nodes

- 1 Number vertices arbitrarily as  $v_1, v_2, \dots, v_n$
- 2  **$\text{dist}(i, j, k)$** : shortest path distance between  $v_i$  and  $v_j$  among all paths in which the largest index of an *intermediate node* is at most  $k$

$$\text{dist}(i, j, 0) = 100$$

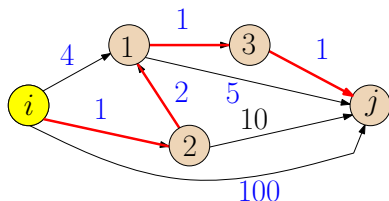

$$\text{dist}(i, j, 1) = 9$$

$$\text{dist}(i, j, 2) = 8$$

$$\text{dist}(i, j, 3) = 5$$

# All-Pairs: Recursion on index of intermediate nodes

- 1 Number vertices arbitrarily as  $v_1, v_2, \dots, v_n$
- 2  **$\text{dist}(i, j, k)$** : shortest path distance between  $v_i$  and  $v_j$  among all paths in which the largest index of an *intermediate node* is at most  **$k$**

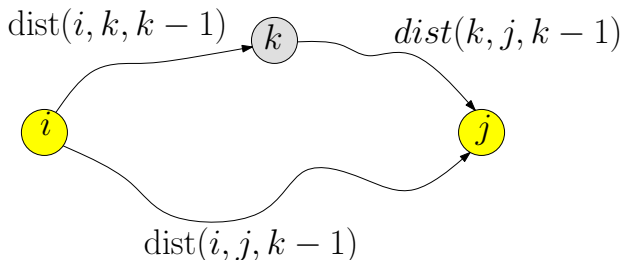

$$\text{dist}(i, j, 0) = 100$$

$$\text{dist}(i, j, 1) = 9$$

$$\text{dist}(i, j, 2) = 8$$

$$\text{dist}(i, j, 3) = 5$$

# All-Pairs: Recursion on index of intermediate nodes

$$\text{dist}(i, j, k) = \min \begin{cases} \text{dist}(i, j, k-1) \\ \text{dist}(i, k, k-1) + \text{dist}(k, j, k-1) \end{cases}$$

Base case:  $\text{dist}(i, j, 0) = c(i, j)$  if  $(i, j) \in E$ , otherwise  $\infty$

**Correctness:** If  $i \rightarrow j$  shortest path goes through  $k$  then  $k$  occurs only once on the path — otherwise there is a negative length cycle.

# Floyd-Warshall Algorithm

for All-Pairs Shortest Paths

```
Check if G has a negative cycle // Bellman-Ford:  $O(mn)$  time
if there is a negative cycle then return "Negative cycle"

for i = 1 to n do
  for j = 1 to n do
     $\text{dist}(i, j, 0) = c(i, j)$  (*  $c(i, j) = \infty$  if  $(i, j) \notin E$ , 0 if  $i = j$  *)

for k = 1 to n do
  for i = 1 to n do
    for j = 1 to n do
       $\text{dist}(i, j, k) = \min \begin{cases} \text{dist}(i, j, k - 1), \\ \text{dist}(i, k, k - 1) + \text{dist}(k, j, k - 1) \end{cases}$ 
```

**Correctness:** Recursion works under the assumption that all shortest paths are defined (no negative length cycle).

**Running Time:**  $\Theta(n^3)$ , **Space:**  $\Theta(n^3)$ .

# Floyd-Warshall Algorithm

for All-Pairs Shortest Paths

```
Check if G has a negative cycle // Bellman-Ford:  $O(mn)$  time
if there is a negative cycle then return "Negative cycle"

for i = 1 to n do

# Floyd-Warshall Algorithm: Finding the Paths

**Question:** Can we find the paths in addition to the distances?

- 1 Create a  $n \times n$  array **Next** that stores the next vertex on shortest path for each pair of vertices
- 2 With array **Next**, for any pair of given vertices **i,j** can compute a shortest path in  **$O(n)$**  time.

# Floyd-Warshall Algorithm: Finding the Paths

**Question:** Can we find the paths in addition to the distances?

- 1 Create a  $n \times n$  array **Next** that stores the next vertex on shortest path for each pair of vertices
- 2 With array **Next**, for any pair of given vertices **i,j** can compute a shortest path in  **$O(n)$**  time.

# Floyd-Warshall Algorithm

## Finding the Paths

```
for i = 1 to n do
  for j = 1 to n do
    dist(i,j,0) = c(i,j) (* c(i,j) =  $\infty$  if (i,j) not edge, 0 if i = j *)
    Next(i,j) = -1
  for k = 1 to n do
    for i = 1 to n do
      for j = 1 to n do
        if (dist(i,j,k-1) > dist(i,k,k-1) + dist(k,j,k-1)) then
          dist(i,j,k) = dist(i,k,k-1) + dist(k,j,k-1)
          Next(i,j) = k
      for i = 1 to n do
        if (dist(i,i,n) < 0) then
          Output that there is a negative length cycle in G
```

**Exercise:** Given **Next** array and any two vertices **i,j** describe an **O(n)** algorithm to find a **i-j** shortest path.

# Summary of results on shortest paths

Single vertex		
No negative edges	Dijkstra	$O(n \log n + m)$
Edges cost might be negative But no negative cycles	Bellman Ford	$O(nm)$

## All Pairs Shortest Paths

No negative edges	$n$ * Dijkstra	$O(n^2 \log n + nm)$
No negative cycles	$n$ * Bellman Ford	$O(n^2 m) = O(n^4)$
No negative cycles	Floyd-Warshall	$O(n^3)$

# Part II

## Knapsack

# Knapsack Problem

- Input** Given a Knapsack of capacity  $W$  lbs. and  $n$  objects with  $i$ th object having weight  $w_i$  and value  $v_i$ ; assume  $W, w_i, v_i$  are all positive integers
- Goal** Fill the Knapsack without exceeding weight limit while maximizing value.

Basic problem that arises in many applications as a sub-problem.

# Knapsack Problem

- Input** Given a Knapsack of capacity  $W$  lbs. and  $n$  objects with  $i$ th object having weight  $w_i$  and value  $v_i$ ; assume  $W, w_i, v_i$  are all positive integers
- Goal** Fill the Knapsack without exceeding weight limit while maximizing value.

Basic problem that arises in many applications as a sub-problem.

# Knapsack Example

## Example

Item	$l_1$	$l_2$	$l_3$	$l_4$	$l_5$
Value	1	6	18	22	28
Weight	1	2	5	6	7

If  $W = 11$ , the best is  $\{l_3, l_4\}$  giving value 40.

## Special Case

When  $v_i = w_i$ , the Knapsack problem is called the **Subset Sum Problem**.

# Greedy Approach

- ① Pick objects with greatest value
  - ① Let  $W = 2$ ,  $w_1 = w_2 = 1$ ,  $w_3 = 2$ ,  $v_1 = v_2 = 2$  and  $v_3 = 3$ ; greedy strategy will pick  $\{3\}$ , but the optimal is  $\{1, 2\}$
- ② Pick objects with smallest weight
  - ① Let  $W = 2$ ,  $w_1 = 1$ ,  $w_2 = 2$ ,  $v_1 = 1$  and  $v_2 = 3$ ; greedy strategy will pick  $\{1\}$ , but the optimal is  $\{2\}$
- ③ Pick objects with largest  $v_i/w_i$  ratio
  - ① Let  $W = 4$ ,  $w_1 = w_2 = 2$ ,  $w_3 = 3$ ,  $v_1 = v_2 = 3$  and  $v_3 = 5$ ; greedy strategy will pick  $\{3\}$ , but the optimal is  $\{1, 2\}$
  - ② Can show that a slight modification always gives half the optimum profit: pick the better of the output of this algorithm and the largest value item. Also, the algorithm gives better approximations when all item weights are small when compared to  $W$ .

# Towards a Recursive Solution

First guess:  $\text{Opt}(i)$  is the optimum solution value for items  $1, \dots, i$ .

## Observation

Consider an optimal solution  $\mathcal{O}$  for  $1, \dots, i$

Case item  $i \notin \mathcal{O}$   $\mathcal{O}$  is an optimal solution to items  $1$  to  $i - 1$

Case item  $i \in \mathcal{O}$  Then  $\mathcal{O} - \{i\}$  is an optimum solution for items  $1$  to  $n - 1$  in knapsack of capacity  $W - w_i$ .

*Subproblems depend also on remaining capacity. Cannot write subproblem only in terms of  $\text{Opt}(1), \dots, \text{Opt}(i - 1)$ .*

$\text{Opt}(i, w)$ : optimum profit for items  $1$  to  $i$  in knapsack of size  $w$

Goal: compute  $\text{Opt}(n, W)$

# Towards a Recursive Solution

First guess:  $\text{Opt}(i)$  is the optimum solution value for items  $1, \dots, i$ .

## Observation

*Consider an optimal solution  $\mathcal{O}$  for  $1, \dots, i$*

*Case item  $i \notin \mathcal{O}$   $\mathcal{O}$  is an optimal solution to items  $1$  to  $i - 1$*

*$\text{Opt}(\mathbf{1}), \dots, \text{Opt}(\mathbf{i} - \mathbf{1})$ .*

$\text{Opt}(\mathbf{i}, \mathbf{w})$ : optimum profit for items  $\mathbf{1}$  to  $\mathbf{i}$  in knapsack of size  $\mathbf{w}$

**Goal:** compute  $\text{Opt}(\mathbf{n}, \mathbf{W})$

# Dynamic Programming Solution

## Definition

Let  $\text{Opt}(\mathbf{i}, \mathbf{w})$  be the optimal way of picking items from  $\mathbf{1}$  to  $\mathbf{i}$ , with total weight not exceeding  $\mathbf{w}$ .

$$\text{Opt}(\mathbf{i}, \mathbf{w}) = \begin{cases} 0 & \text{if } \mathbf{i} = 0 \\ \text{Opt}(\mathbf{i} - 1, \mathbf{w}) & \text{if } \mathbf{w}_i > \mathbf{w} \\ \max \begin{cases} \text{Opt}(\mathbf{i} - 1, \mathbf{w}) \\ \text{Opt}(\mathbf{i} - 1, \mathbf{w} - \mathbf{w}_i) + \mathbf{v}_i \end{cases} & \text{otherwise} \end{cases}$$

# An Iterative Algorithm

```
for  $w = 0$  to  $W$  do
   $M[0, w] = 0$ 
for  $i = 1$  to  $n$  do
  for  $w = 1$  to  $W$  do
    if  $(w_i > w)$  then
       $M[i, w] = M[i - 1, w]$ 
    else
       $M[i, w] = \max(M[i - 1, w], M[i - 1, w - w_i] + v_i)$ 
```

## Running Time

- 1 Time taken is  $O(nW)$
- 2 Input has size  $O(n + \log W + \sum_{i=1}^n (\log v_i + \log w_i))$ ; so running time not polynomial but “pseudo-polynomial”!

# An Iterative Algorithm

```
for  $w = 0$  to  $W$  do
   $M[0, w] = 0$ 
  for  $i = 1$  to  $n$  do
    for  $w = 1$  to  $W$  do
      if  $(w_i > w)$  then
         $M[i, w] = M[i - 1, w]$ 
      else
         $M[i, w] = \max(M[i - 1, w], M[i - 1, w - w_i] + v_i)$ 
```

## Running Time

- ① Time taken is  $O(nW)$
- ② Input has size  $O(n + \log W + \sum_{i=1}^n (\log v_i + \log w_i))$ ; so running time not polynomial but “pseudo-polynomial”!

# An Iterative Algorithm

```
for  $w = 0$  to  $W$  do
   $M[0, w] = 0$ 
for  $i = 1$  to  $n$  do
  for  $w = 1$  to  $W$  do
    if  $(w_i > w)$  then
       $M[i, w] = M[i - 1, w]$ 
    else
       $M[i, w] = \max(M[i - 1, w], M[i - 1, w - w_i] + v_i)$ 
```

## Running Time

- ① Time taken is  $O(nW)$
- ② Input has size  $O(n + \log W + \sum_{i=1}^n (\log v_i + \log w_i))$ ; so running time not polynomial but “pseudo-polynomial”!

# Knapsack Algorithm and Polynomial time

- 1 Input size for Knapsack:  
 $O(n) + \log W + \sum_{i=1}^n (\log w_i + \log v_i)$ .
- 2 Running time of dynamic programming algorithm:  $O(nW)$ .
- 3 Not a polynomial time algorithm.
- 4 Example:  $W = 2^n$  and  $w_i, v_i \in [1..2^n]$ . Input size is  $O(n^2)$ , running time is  $O(n2^n)$  arithmetic/comparisons.
- 5 Algorithm is called a **pseudo-polynomial** time algorithm because running time is polynomial if *numbers* in input are of size polynomial in the **combinatorial size** of problem.
- 6 Knapsack is **NP-Hard** if numbers are not polynomial in  $n$ .

# Knapsack Algorithm and Polynomial time

## Part III

# Traveling Salesman Problem

# Traveling Salesman Problem

**Input** A graph  $\mathbf{G} = (\mathbf{V}, \mathbf{E})$  with non-negative edge costs/lengths.  $\mathbf{c}(\mathbf{e})$  for edge  $\mathbf{e}$

**Goal** Find a tour of minimum cost that visits each node.

No polynomial time algorithm known. Problem is **NP-Hard**.

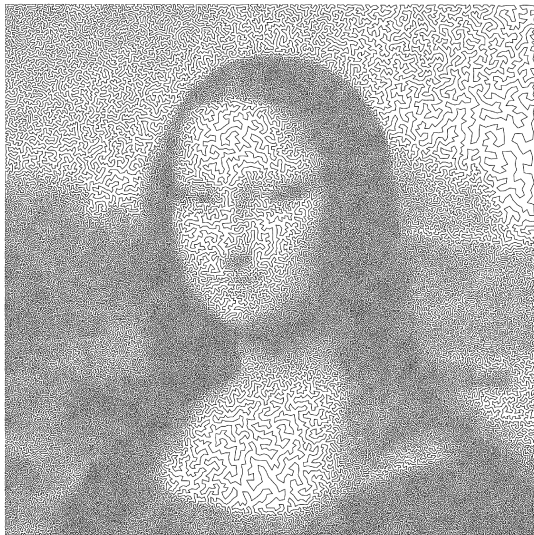

# Traveling Salesman Problem

**Input** A graph  $\mathbf{G} = (\mathbf{V}, \mathbf{E})$  with non-negative edge costs/lengths.  $\mathbf{c}(\mathbf{e})$  for edge  $\mathbf{e}$

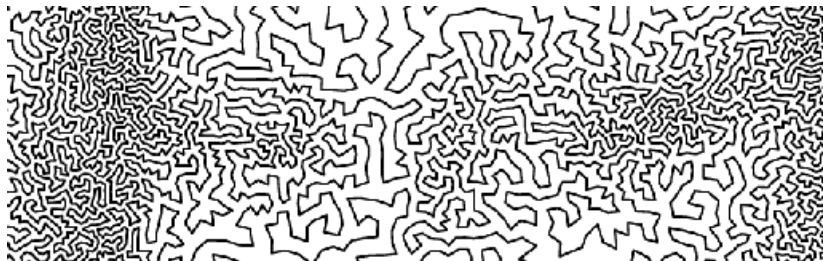

**Goal** Find a tour of minimum cost that visits each node.

No polynomial time algorithm known. Problem is **NP-Hard**.

# Drawings using TSP

# Drawings using TSP

# Example: optimal tour for cities of a country (which one?)

# An Exponential Time Algorithm

How many different tours are there?  $n!$

Stirling's formula:  $n! \simeq \sqrt{n}(n/e)^n$  which is  $\Theta(2^{cn \log n})$  for some constant  $c > 1$

Can we do better? Can we get a  $2^{O(n)}$  time algorithm?

# Towards a Recursive Solution

- 1 Order vertices as  $\mathbf{v}_1, \mathbf{v}_2, \dots, \mathbf{v}_n$
- 2 **OPT(S)**: optimum **TSP** tour for the vertices  $\mathbf{S} \subseteq \mathbf{V}$  in the graph restricted to **S**. Want **OPT(V)**.

Can we compute **OPT(S)** recursively?

- 1 Say  $\mathbf{v} \in \mathbf{S}$ . What are the two neighbors of  $\mathbf{v}$  in optimum tour in **S**?
- 2 If  $\mathbf{u}, \mathbf{w}$  are neighbors of  $\mathbf{v}$  in an optimum tour of **S** then removing  $\mathbf{v}$  gives an optimum *path* from  $\mathbf{u}$  to  $\mathbf{w}$  visiting all nodes in  $\mathbf{S} - \{\mathbf{v}\}$ .

Path from  $\mathbf{u}$  to  $\mathbf{w}$  is not a recursive subproblem! Need to find a more general problem to allow recursion.

# A More General Problem: TSP Path

**Input** A graph  $G = (V, E)$  with non-negative edge costs/lengths( $c(e)$  for edge  $e$ ) and two nodes  $s, t$

**Goal** Find a path from  $s$  to  $t$  of minimum cost that visits each node exactly once.

Can solve **TSP** using above. Do you see how?

Recursion for optimum **TSP** Path problem:

- 1 **OPT( $u, v, S$ )**: optimum **TSP** Path from  $u$  to  $v$  in the graph restricted to  $S$  (here  $u, v \in S$ ).

# A More General Problem: TSP Path

Continued...

What is the next node in the optimum path from **u** to **v**? Suppose it is **w**. Then what is **OPT(u, v, S)**?

$$\text{OPT}(u, v, S) = c(u, w) + \text{OPT}(w, v, S - \{u\})$$

We do not know **w**! So try all possibilities for **w**.

# A More General Problem: TSP Path

Continued...

What is the next node in the optimum path from **u** to **v**? Suppose it is **w**. Then what is **OPT(u, v, S)**?

$$\text{OPT}(u, v, S) = c(u, w) + \text{OPT}(w, v, S - \{u\})$$

We do not know **w**! So try all possibilities for **w**.

# A Recursive Solution

$$\text{OPT}(u, v, S) = \min_{w \in S, w \neq u, v} (c(u, w) + \text{OPT}(w, v, S - \{u\}))$$

What are the subproblems for the original problem  $\text{OPT}(s, t, V)$ ?  
 $\text{OPT}(u, v, S)$  for  $u, v \in S, S \subseteq V$ .

How many subproblems?

- ① number of distinct subsets  $S$  of  $V$  is at most  $2^n$
- ② number of pairs of nodes in a set  $S$  is at most  $n^2$
- ③ hence number of subproblems is  $O(n^2 2^n)$

**Exercise:** Show that one can compute TSP using above dynamic program in  $O(n^3 2^n)$  time and  $O(n^2 2^n)$  space.

Disadvantage of dynamic programming solution: memory!

# Dynamic Programming: Postscript

Dynamic Programming = Smart Recursion + Memoization

- 1 How to come up with the recursion?
- 2 How to recognize that dynamic programming may apply?

# Dynamic Programming: Postscript

Dynamic Programming = Smart Recursion + Memoization

- 1 How to come up with the recursion?
- 2 How to recognize that dynamic programming may apply?

# Some Tips

- 1 Problems where there is a *natural* linear ordering: sequences, paths, intervals, **DAGs** etc. Recursion based on ordering (left to right or right to left or topological sort) usually works.
- 2 Problems involving trees: recursion based on subtrees.
- 3 More generally:
  - 1 Problem admits a natural recursive divide and conquer
  - 2 If optimal solution for whole problem can be simply composed from optimal solution for each separate pieces then plain divide and conquer works directly
  - 3 If optimal solution depends on all pieces then can apply dynamic programming if *interface/interaction* between pieces is *limited*. Augment recursion to not simply find an optimum solution but also an optimum solution for each possible way to interact with the other pieces.

# Examples

- 1 Longest Increasing Subsequence: break sequence in the middle say. What is the interaction between the two pieces in a solution?
- 2 Sequence Alignment: break both sequences in two pieces each. What is the interaction between the two sets of pieces?
- 3 Independent Set in a Tree: break tree at root into subtrees. What is the interaction between the subtrees?
- 4 Independent Set in an graph: break graph into two graphs. What is the interaction? Very high!
- 5 Knapsack: Split items into two sets of half each. What is the interaction?
