Chapter 21

Reductions and NP

CS 473: Fundamental Algorithms, Spring 2013 April 11, 2013

21.1 Reductions Continued

21.1.1 Polynomial Time Reduction

21.1.1.1 Karp reduction

A **polynomial time reduction** from a decision problem X to a decision problem Y is an algorithm A that has the following properties:

- (A) given an instance I_X of X, A produces an instance I_Y of Y
- (B) \mathcal{A} runs in time polynomial in $|I_X|$. This implies that $|I_Y|$ (size of I_Y) is polynomial in $|I_X|$
- (C) Answer to I_X YES iff answer to I_Y is YES. Notation: $X \leq_P Y$ if X reduces to Y

Proposition 21.1.1. If $X \leq_P Y$ then a polynomial time algorithm for Y implies a polynomial time algorithm for X.

Such a reduction is called a *Karp reduction*. Most reductions we will need are Karp reductions.

21.1.2 A More General Reduction

21.1.2.1 Turing Reduction

Definition 21.1.2 (Turing reduction.). Problem X polynomial time reduces to Y if there is an algorithm A for X that has the following properties:

(A) on any given instance I_X of X, A uses polynomial in $|I_X|$ "steps"

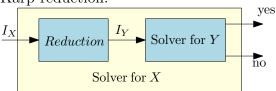

- (B) a step is either a standard computation step, or
- (C) a sub-routine call to an algorithm that solves Y.

This is a Turing reduction.

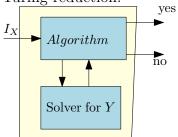

Note: In making sub-routine call to algorithm to solve Y, \mathcal{A} can only ask questions of size polynomial in $|I_X|$. Why?

21.1.2.2 Comparing reductions

(A) Karp reduction:

(B) Turing reduction:

Turing reduction

- (A) Algorithm to solve X can call solver for Y many times.
- (B) Conceptually, every call to the solver of Y takes constant time.

21.1.2.3 Example of Turing Reduction

Problem 21.1.3 (Independent set in circular arcs graph.).

Input: Collection of arcs on a circle.

 $\textbf{Goal:} \ \ \textit{Compute the maximum number of non-overlapping arcs}.$

Reduced to the following problem:?

Problem 21.1.4 (Independent set of intervals.).

Input: Collection of intervals on the line.

 ${\bf Goal:}\ \ Compute\ the\ maximum\ number\ of\ non-overlapping\ intervals.$

How? Used algorithm for interval problem multiple times.

21.1.2.4 Turing vs Karp Reductions

- (A) Turing reductions more general than Karp reductions.
- (B) Turing reduction useful in obtaining algorithms via reductions.
- (C) Karp reduction is simpler and easier to use to prove hardness of problems.
- (D) Perhaps surprisingly, Karp reductions, although limited, suffice for most known NP-Completeness proofs.
- (E) Karp reductions allow us to distinguish between **NP** and **co-NP** (more on this later).

21.1.3 The Satisfiability Problem (SAT)

21.1.3.1 Propositional Formulas

Definition 21.1.5. Consider a set of boolean variables $x_1, x_2, \dots x_n$.

- (A) A literal is either a boolean variable x_i or its negation $\neg x_i$.
- (B) A clause is a disjunction of literals. For example, $x_1 \lor x_2 \lor \neg x_4$ is a clause.
- (C) A formula in conjunctive normal form (CNF) is propositional formula which is a conjunction of clauses
 - (A) $(x_1 \lor x_2 \lor \neg x_4) \land (x_2 \lor \neg x_3) \land x_5$ is a CNF formula.
- (D) A formula φ is a 3CNF:

A CNF formula such that every clause has **exactly** 3 literals.

(A) $(x_1 \lor x_2 \lor \neg x_4) \land (x_2 \lor \neg x_3 \lor x_1)$ is a 3CNF formula, but $(x_1 \lor x_2 \lor \neg x_4) \land (x_2 \lor \neg x_3) \land x_5$ is not.

21.1.3.2 Satisfiability

Problem: SAT

Instance: A CNF formula φ .

Question: Is there a truth assignment to the variable of φ such that φ evaluates to true?

Problem: 3SAT

Instance: A 3CNF formula φ .

Question: Is there a truth assignment to the variable of φ such that φ

evaluates to true?

21.1.3.3 Satisfiability **SAT** Given a CNF formula φ , is there a truth assignment to variables such that φ evaluates to true?

Example 21.1.6. (A) $(x_1 \lor x_2 \lor \neg x_4) \land (x_2 \lor \neg x_3) \land x_5$ is satisfiable; take $x_1, x_2, \dots x_5$ to be all true

(B) $(x_1 \vee \neg x_2) \wedge (\neg x_1 \vee x_2) \wedge (\neg x_1 \vee \neg x_2) \wedge (x_1 \vee x_2)$ is not satisfiable.

3SAT Given a 3CNF formula φ , is there a truth assignment to variables such that φ evaluates to true?

(More on **2SAT** in a bit...)

21.1.3.4 Importance of SAT and 3SAT

- (A) **SAT** and **3SAT** are basic constraint satisfaction problems.
- (B) Many different problems can reduced to them because of the simple yet powerful expressively of logical constraints.
- (C) Arise naturally in many applications involving hardware and software verification and correctness.
- (D) As we will see, it is a fundamental problem in theory of NP-Completeness.

21.1.4 SAT and 3SAT

21.1.4.1 SAT \leq_P 3SAT

How **SAT** is different from **3SAT**?In **SAT** clauses might have arbitrary length: 1, 2, 3, ... variables:

$$(x \lor y \lor z \lor w \lor u) \land (\neg x \lor \neg y \lor \neg z \lor w \lor u) \land (\neg x)$$

In **3SAT** every clause must have *exactly* 3 different literals.

To reduce from an instance of **SAT** to an instance of **3SAT**, we must make all clauses to have exactly 3 variables...

Basic idea

- (A) Pad short clauses so they have 3 literals.
- (B) Break long clauses into shorter clauses.
- (C) Repeat the above till we have a 3CNF.

21.1.4.2 3SAT $<_P$ SAT

- (A) **3SAT** \leq_P **SAT**.
- (B) Because...

A **3SAT** instance is also an instance of **SAT**.

21.1.4.3 SAT \leq_P 3SAT

Claim 21.1.7. SAT \leq_P 3SAT.

Given φ a **SAT** formula we create a **3SAT** formula φ' such that

- (A) φ is satisfiable iff φ' is satisfiable.
- (B) φ' can be constructed from φ in time polynomial in $|\varphi|$.

Idea: if a clause of φ is not of length 3, replace it with several clauses of length exactly 3.

21.1.5 SAT $<_P$ 3SAT

21.1.5.1 A clause with a single literal

Reduction Ideas Challenge: Some of the clauses in φ may have less or more than 3 literals. For each clause with < 3 or > 3 literals, we will construct a set of logically equivalent clauses.

(A) Case clause with one literal: Let c be a clause with a single literal (i.e., $c = \ell$). Let u, v be new variables. Consider

$$c' = (\ell \lor u \lor v) \land (\ell \lor u \lor \neg v)$$
$$\land (\ell \lor \neg u \lor v) \land (\ell \lor \neg u \lor \neg v).$$

Observe that c' is satisfiable iff c is satisfiable

21.1.6 SAT \leq_P 3SAT

21.1.6.1 A clause with two literals

Reduction Ideas: 2 and more literals

(A) Case clause with 2 literals: Let $c = \ell_1 \vee \ell_2$. Let u be a new variable. Consider

$$c' = \left(\ell_1 \vee \ell_2 \vee u\right) \wedge \left(\ell_1 \vee \ell_2 \vee \neg u\right).$$

Again c is satisfiable iff c' is satisfiable

21.1.6.2 Breaking a clause

Lemma 21.1.8. For any boolean formulas X and Y and z a new boolean variable. Then

$$X \vee Y$$
 is satisfiable

if and only if, z can be assigned a value such that

$$(X \lor z) \land (Y \lor \neg z)$$
 is satisfiable

(with the same assignment to the variables appearing in X and Y).

21.1.7 SAT \leq_P 3SAT (contd)

21.1.7.1 Clauses with more than 3 literals

Let $c = \ell_1 \vee \cdots \vee \ell_k$. Let $u_1, \dots u_{k-3}$ be new variables. Consider

$$c' = \left(\ell_1 \vee \ell_2 \vee u_1\right) \wedge \left(\ell_3 \vee \neg u_1 \vee u_2\right)$$
$$\wedge \left(\ell_4 \vee \neg u_2 \vee u_3\right) \wedge$$
$$\cdots \wedge \left(\ell_{k-2} \vee \neg u_{k-4} \vee u_{k-3}\right) \wedge \left(\ell_{k-1} \vee \ell_k \vee \neg u_{k-3}\right).$$

Claim 21.1.9. c is satisfiable iff c' is satisfiable.

Another way to see it — reduce size of clause by one:

$$c' = \left(\ell_1 \vee \ell_2 \ldots \vee \ell_{k-2} \vee u_{k-3}\right) \wedge \left(\ell_{k-1} \vee \ell_k \vee \neg u_{k-3}\right).$$

21.1.7.2 An Example

Example 21.1.10.

$$\varphi = \left(\neg x_1 \lor \neg x_4\right) \land \left(x_1 \lor \neg x_2 \lor \neg x_3\right)$$
$$\land \left(\neg x_2 \lor \neg x_3 \lor x_4 \lor x_1\right) \land \left(x_1\right).$$

Equivalent form:

$$\psi = (\neg x_1 \lor \neg x_4 \lor z) \land (\neg x_1 \lor \neg x_4 \lor \neg z)$$

$$\land (x_1 \lor \neg x_2 \lor \neg x_3)$$

$$\land (\neg x_2 \lor \neg x_3 \lor y_1) \land (x_4 \lor x_1 \lor \neg y_1)$$

$$\land (x_1 \lor u \lor v) \land (x_1 \lor u \lor \neg v)$$

$$\land (x_1 \lor \neg u \lor v) \land (x_1 \lor \neg u \lor \neg v).$$

21.1.8 Overall Reduction Algorithm

21.1.8.1 Reduction from SAT to 3SAT

Correctness (informal) φ is satisfiable iff ψ is satisfiable because for each clause c, the new 3CNF formula c' is logically equivalent to c.

21.1.8.2 What about **2SAT**?

2SAT can be solved in polynomial time! (specifically, linear time!)

No known polynomial time reduction from **SAT** (or **3SAT**) to **2SAT**. If there was, then **SAT** and **3SAT** would be solvable in polynomial time.

Why the reduction from **3SAT** to **2SAT** fails?

Consider a clause $(x \lor y \lor z)$. We need to reduce it to a collection of 2CNF clauses. Introduce a face variable α , and rewrite this as

$$(x \lor y \lor \alpha) \land (\neg \alpha \lor z)$$
 (bad! clause with 3 vars) or $(x \lor \alpha) \land (\neg \alpha \lor y \lor z)$ (bad! clause with 3 vars).

(In animal farm language: **2SAT** good, **3SAT** bad.)

21.1.8.3 What about **2SAT**?

A challenging exercise: Given a **2SAT** formula show to compute its satisfying assignment...

(Hint: Create a graph with two vertices for each variable (for a variable x there would be two vertices with labels x = 0 and x = 1). For ever 2CNF clause add two directed edges in the graph. The edges are implication edges: They state that if you decide to assign a certain value to a variable, then you must assign a certain value to some other variable.

Now compute the strong connected components in this graph, and continue from there...)

21.1.9 3SAT and Independent Set

21.1.9.1 Independent Set

Problem: Independent Set

Instance: A graph G , integer k.

Question: Is there an independent set in G of size k?

21.1.9.2 **3SAT** \leq_P Independent Set

The reduction **3SAT** \leq_P **Independent Set Input:** Given a **3CNF** formula φ

Goal: Construct a graph G_{φ} and number k such that G_{φ} has an independent set of size k if and only if φ is satisfiable.

 G_{φ} should be constructable in time polynomial in size of φ

Importance of reduction: Although **3SAT** is much more expressive, it can be reduced to a seemingly specialized Independent Set problem.

Notice: We handle only **3CNF** formulas – reduction would not work for other kinds of boolean formulas.

21.1.9.3 Interpreting **3SAT**

There are two ways to think about **3SAT**

- (A) Find a way to assign 0/1 (false/true) to the variables such that the formula evaluates to true, that is each clause evaluates to true.
- (B) Pick a literal from each clause and find a truth assignment to make all of them true. You will fail if two of the literals you pick are in **conflict**, i.e., you pick x_i and $\neg x_i$ We will take the second view of **3SAT** to construct the reduction.

21.1.9.4 The Reduction

- (A) G_{φ} will have one vertex for each literal in a clause
- (B) Connect the 3 literals in a clause to form a triangle; the independent set will pick at most one vertex from each clause, which will correspond to the literal to be set to true
- (C) Connect 2 vertices if they label complementary literals; this ensures that the literals corresponding to the independent set do not have a conflict
- (D) Take k to be the number of clauses

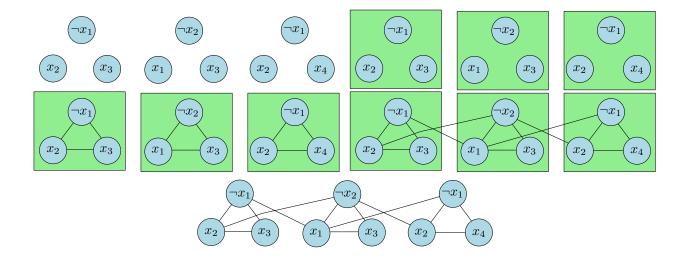

Figure 21.1: Graph for $\varphi = (\neg x_1 \lor x_2 \lor x_3) \land (x_1 \lor \neg x_2 \lor x_3) \land (\neg x_1 \lor x_2 \lor x_4)$

21.1.9.5 Correctness

Proposition 21.1.11. φ is satisfiable iff G_{φ} has an independent set of size k (= number of clauses in φ).

Proof:

- \Rightarrow Let a be the truth assignment satisfying φ
 - (A) Pick one of the vertices, corresponding to true literals under a, from each triangle. This is an independent set of the appropriate size

21.1.9.6 Correctness (contd)

Proposition 21.1.12. φ is satisfiable iff G_{φ} has an independent set of size k (= number of clauses in φ).

Proof:

- \Leftarrow Let S be an independent set of size k
 - (A) S must contain exactly one vertex from each clause
 - (B) S cannot contain vertices labeled by conflicting clauses
 - (C) Thus, it is possible to obtain a truth assignment that makes in the literals in S true; such an assignment satisfies one literal in every clause

21.1.9.7 Transitivity of Reductions

Lemma 21.1.13. $X \leq_P Y$ and $Y \leq_P Z$ implies that $X \leq_P Z$.

8

Note: $X \leq_P Y$ does not imply that $Y \leq_P X$ and hence it is very important to know the FROM and TO in a reduction.

To prove $X \leq_P Y$ you need to show a reduction FROM X TO Y In other words show that an algorithm for Y implies an algorithm for X.

21.2 Definition of NP

21.2.0.8 Recap ...

Problems

- (A) Independent Set
- (B) Vertex Cover
- (C) Set Cover
- (D) SAT
- (E) **3SAT**

Relationship

3SAT
$$\leq_P$$
 Independent Set $\overset{\leq_P}{\geq_P}$ Vertex Cover \leq_P Set Cover 3SAT \leq_P SAT \leq_P 3SAT

21.3 Preliminaries

21.3.1 Problems and Algorithms

21.3.1.1 Problems and Algorithms: Formal Approach

Decision Problems

- (A) **Problem Instance:** Binary string s, with size |s|
- (B) **Problem:** A set X of strings on which the answer should be "yes"; we call these YES instances of X. Strings not in X are NO instances of X.

Definition 21.3.1. (A) A is an algorithm for problem X if A(s) = "yes" iff $s \in X$.

(B) A is said to have a **polynomial running time** if there is a polynomial $p(\cdot)$ such that for every string s, A(s) terminates in at most O(p(|s|)) steps.

21.3.1.2 Polynomial Time

Definition 21.3.2. Polynomial time (denoted by P) is the class of all (decision) problems that have an algorithm that solves it in polynomial time.

Example 21.3.3. Problems in P include

- (A) Is there a shortest path from s to t of length $\leq k$ in G?
- (B) Is there a flow of value $\geq k$ in network G?
- (C) Is there an assignment to variables to satisfy given linear constraints?

21.3.1.3 Efficiency Hypothesis

A problem X has an efficient algorithm iff $X \in \mathbf{P}$, that is X has a polynomial time algorithm. Justifications:

- (A) Robustness of definition to variations in machines.
- (B) A sound theoretical definition.
- (C) Most known polynomial time algorithms for "natural" problems have small polynomial running times.

21.3.1.4 Problems with no known polynomial time algorithms

Problems

- (A) Independent Set
- (B) Vertex Cover
- (C) **Set Cover**
- (D) **SAT**
- (E) **3SAT**

There are of course undecidable problems (no algorithm at all!) but many problems that we want to solve are of similar flavor to the above.

Question: What is common to above problems?

21.3.1.5 Efficient Checkability

Above problems share the following feature:

Checkability For any YES instance I_X of X there is a proof/certificate/solution that is of length $poly(|I_X|)$ such that given a proof one can efficiently check that I_X is indeed a YES instance.

Examples:

- (A) **SAT** formula φ : proof is a satisfying assignment.
- (B) Independent Set in graph G and k: a subset S of vertices.

21.3.2 Certifiers/Verifiers

21.3.2.1 Certifiers

Definition 21.3.4. An algorithm $C(\cdot, \cdot)$ is a **certifier** for problem X if for every $s \in X$ there is some string t such that C(s, t) = "yes", and conversely, if for some s and t, C(s, t) = "yes" then $s \in X$.

The string t is called a **certificate** or **proof** for s.

Definition 21.3.5 (Efficient Certifier.). A certifier C is an **efficient certifier** for problem X if there is a polynomial $p(\cdot)$ such that for every string s, we have that

- $\star \ s \in X \ if \ and \ only \ if$
- \star there is a string t:
 - (A) $|t| \leq p(|s|),$
 - (B) C(s,t) = "yes",
 - (C) and C runs in polynomial time.

21.3.2.2 Example: Independent Set

- (A) **Problem:** Does G = (V, E) have an independent set of size $\geq k$?
 - (A) Certificate: Set $S \subseteq V$.
 - (B) Certifier: Check $|S| \ge k$ and no pair of vertices in S is connected by an edge.

21.3.3 Examples

21.3.3.1 Example: Vertex Cover

- (A) **Problem:** Does G have a vertex cover of size $\leq k$?
 - (A) Certificate: $S \subseteq V$.
 - (B) Certifier: Check $|S| \leq k$ and that for every edge at least one endpoint is in S.

21.3.3.2 Example: **SAT**

- (A) **Problem:** Does formula φ have a satisfying truth assignment?
 - (A) Certificate: Assignment a of 0/1 values to each variable.
 - (B) Certifier: Check each clause under a and say "yes" if all clauses are true.

21.3.3.3 Example: Composites

Problem: Composite

Instance: A number s.

Question: Is the number s a composite?

- (A) Problem: Composite.
 - (A) Certificate: A factor $t \leq s$ such that $t \neq 1$ and $t \neq s$.
 - (B) Certifier: Check that t divides s.

21.4 *NP*

21.4.1 Definition

21.4.1.1 Nondeterministic Polynomial Time

Definition 21.4.1. Nondeterministic Polynomial Time (denoted by NP) is the class of all problems that have efficient certifiers.

Example 21.4.2. Independent Set, Vertex Cover, Set Cover, SAT, 3SAT, and Composite are all examples of problems in NP.

21.4.2 Why is it called...

21.4.2.1 Nondeterministic Polynomial Time

A certifier is an algorithm C(I, c) with two inputs:

(A) I: instance.

- (B) c: proof/certificate that the instance is indeed a YES instance of the given problem. One can think about C as an algorithm for the original problem, if:
- (A) Given I, the algorithm guess (non-deterministically, and who knows how) the certificate c.
- (B) The algorithm now verifies the certificate c for the instance I. Usually NP is described using Turing machines (gag).

21.4.2.2 Asymmetry in Definition of NP

Note that only YES instances have a short proof/certificate. NO instances need not have a short certificate.

Example 21.4.3. SAT formula φ . No easy way to prove that φ is NOT satisfiable!

More on this and **co-NP** later on.

21.4.3 Intractability

21.4.3.1 *P* versus *NP*

Proposition 21.4.4. $P \subseteq NP$.

For a problem in P no need for a certificate!

Proof: Consider problem $X \in \mathbb{P}$ with algorithm A. Need to demonstrate that X has an efficient certifier:

- (A) Certifier C on input s, t, runs A(s) and returns the answer.
- (B) C runs in polynomial time.
- (C) If $s \in X$, then for every t, C(s,t) = "yes".
- (D) If $s \notin X$, then for every t, C(s,t) ="no".

21.4.3.2 Exponential Time

Definition 21.4.5. Exponential Time (denoted EXP) is the collection of all problems that have an algorithm which on input s runs in exponential time, i.e., $O(2^{\text{poly}(|s|)})$.

Example: $O(2^n)$, $O(2^{n \log n})$, $O(2^{n^3})$, ...

21.4.3.3 *NP* **versus** *EXP*

Proposition 21.4.6. NP \subseteq EXP.

Proof: Let $X \in \mathbb{NP}$ with certifier C. Need to design an exponential time algorithm for X.

- (A) For every t, with $|t| \leq p(|s|)$ run C(s,t); answer "yes" if any one of these calls returns "ves".
- (B) The above algorithm correctly solves X (exercise).
- (C) Algorithm runs in $O(q(|s| + |p(s)|)2^{p(|s|)})$, where q is the running time of C.

21.4.3.4 Examples

- (A) **SAT**: try all possible truth assignment to variables.
- (B) **Independent Set**: try all possible subsets of vertices.
- (C) **Vertex Cover**: try all possible subsets of vertices.

21.4.3.5 Is NP efficiently solvable?

We know $P \subseteq NP \subseteq EXP$.

Big Question Is there are problem in NP that does not belong to P? Is P = NP?

21.4.4 If $P = NP \dots$

21.4.4.1 Or: If pigs could fly then life would be sweet.

- (A) Many important optimization problems can be solved efficiently.
- (B) The RSA cryptosystem can be broken.
- (C) No security on the web.
- (D) No e-commerce . . .
- (E) Creativity can be automated! Proofs for mathematical statement can be found by computers automatically (if short ones exist).

21.4.4.2 *P* versus *NP*

Status Relationship between **P** and **NP** remains one of the most important open problems in mathematics/computer science.

Consensus: Most people feel/believe $P \neq NP$.

Resolving P versus NP is a Clay Millennium Prize Problem. You can win a million dollars in addition to a Turing award and major fame!

21.5 Not for lecture: Converting any boolean formula into CNF

21.5.0.3 The dark art of formula conversion into CNF

Consider an arbitrary boolean formula ϕ defined over k variables. To keep the discussion concrete, consider the formula $\phi \equiv x_k = x_i \wedge x_j$. We would like to convert this formula into an equivalent CNF formula.

21.5.1 Formula conversion into CNF

21.5.1.1 Step 1

Build a truth table for the boolean formula.

| | | | value of |
|-------|-------|-------|------------------------|
| x_k | x_i | x_j | $x_k = x_i \wedge x_j$ |
| 0 | 0 | 0 | 1 |
| 0 | 0 | 1 | 1 |
| 0 | 1 | 0 | 1 |
| 0 | 1 | 1 | 0 |
| 1 | 0 | 0 | 0 |
| 1 | 0 | 1 | 0 |
| 1 | 1 | 0 | 0 |
| 1 | 1 | 1 | 1 |

21.5.2 Formula conversion into CNF

21.5.2.1 Step 1.5 - understand what a single CNF clause represents

Given an assignment, say, $x_k = 1$, $k_i = 1$ and $k_j = 0$, consider the CNF clause $x_k \vee x_i \vee \overline{x_j}$ (you negate a variable if it is assigned zero). Its truth table is

| x_k | x_i | x_j | $x_k \vee x_i \vee \overline{x_j}$ |
|-------|-------|-------|------------------------------------|
| 0 | 0 | 0 | 1 |
| 0 | 0 | 1 | 1 |
| 0 | 1 | 0 | 1 |
| 0 | 1 | 1 | 1 |
| 1 | 0 | 0 | 1 |
| 1 | 0 | 1 | 1 |
| 1 | 1 | 0 | 0 |
| 1 | 1 | 1 | 1 |

Observe that a single clause assigns zero to one row, and one everywhere else. An conjunction of several such clauses, as such, would result in a formula that is 0 in all the rows that corresponds to these clauses, and one everywhere else.

21.5.3 Formula conversion into CNF

21.5.3.1 Step 2

Write down the CNF clause for every row in the table that is zero.

| x_k | x_i | x_j | $x_k = x_i \wedge x_j$ | CNF clause |
|-------|-------|-------|------------------------|---|
| 0 | 0 | 0 | 1 | |
| 0 | 0 | 1 | 1 | |
| 0 | 1 | 0 | 1 | |
| 0 | 1 | 1 | 0 | $\overline{x_k} \lor x_i \lor x_j$ |
| 1 | 0 | 0 | 0 | $x_k \vee \overline{x_i} \vee \overline{x_j}$ |
| 1 | 0 | 1 | 0 | $x_k \vee \overline{x_i} \vee x_j$ |
| 1 | 1 | 0 | 0 | $x_k \vee x_i \vee \overline{x_j}$ |
| 1 | 1 | 1 | 1 | |

The conjunction (i.e., and) of all these clauses is clearly equivalent to the original formula. In this case $\psi \equiv (\overline{x_k} \vee x_i \vee x_j) \wedge (x_k \vee \overline{x_i} \vee \overline{x_j}) \wedge (x_k \vee \overline{x_i} \vee x_j) \wedge (x_k \vee x_i \vee \overline{x_j})$

21.5.4 Formula conversion into CNF

21.5.4.1 Step 3 - simplify if you want to

We conclude:

```
Using that (x \vee y) \wedge (x \vee \overline{y}) = x, we have that:

(A) (x_k \vee \overline{x_i} \vee \overline{x_j}) \wedge (x_k \vee \overline{x_i} \vee x_j) is equivalent to (x_k \vee \overline{x_i}).

(B) (x_k \vee \overline{x_i} \vee \overline{x_j}) \wedge (x_k \vee x_i \vee \overline{x_j}) is equivalent to (x_k \vee \overline{x_j}).

Using the above two observation, we have that our formula \psi \equiv (\overline{x_k} \vee x_i \vee x_j) \wedge (x_k \vee \overline{x_i} \vee \overline{x_j}) \wedge (x_k \vee \overline{x_i} \vee x_j) \wedge (x_k \vee x_i \vee \overline{x_j}) is equivalent to \psi \equiv (\overline{x_k} \vee x_i \vee x_j) \wedge (x_k \vee \overline{x_i}) \wedge (x_k \vee \overline{x_j}).
```

Lemma 21.5.1. The formula $x_k = x_i \wedge x_j$ is equivalent to the CNF formula $\psi \equiv (\overline{x_k} \vee x_i \vee x_j) \wedge (x_k \vee \overline{x_i}) \wedge (x_k \vee \overline{x_j})$.
