 $\frac{(P \Rightarrow P')\{P'\} \ C \ \{Q\}}{\{P\} \ C \ \{Q\}}$ 

• Meaning: If we can show that P implies P' (i.e.  $(P \Rightarrow P')$  and we can show that  $\{P\}$  C  $\{Q\}$ , then we know that  $\{P\}$  C  $\{Q\}$ 

#### Precondition Strengthening

• Examples:

$$\frac{x = 3 \Rightarrow x < 7 \quad \{x < 7\} \ x := x + 3 \ \{x < 10\}}{\{x = 3\} \ x := x + 3 \ \{x < 10\}}$$

$$\frac{\textit{True} \Rightarrow (2=2) \quad \{2=2\} \ x := 2 \ \{x=2\}}{\{\textit{True}\} \ x := 2 \ \{x=2\}}$$

$$\frac{x = n \Rightarrow x + 1 = n + 1}{\{x = n + 1\}} \frac{\{x + 1 = n + 1\}}{\{x = n\}} \frac{\{x = n + 1\}}{\{x = n + 1\}}$$

Which Inferences Are Correct?

• P is stronger than P' means  $P \Rightarrow P'$ 

Precondition Strengthening

$$\frac{\{x > 0 \land x < 5\} \ x \ := \ x * x \ \{x < 25\}}{\{x = 3\} \ x \ := \ x * x \ \{x < 25\}}$$

$$\frac{\{x=3\} \ x \ := \ x * x \{x < 25\}}{\{x > 0 \land x < 5\} \ x \ := \ x * x \{x < 25\}}$$

$$\frac{\{x * x < 25\} \ x := x * x \{x < 25\}}{\{x > 0 \land x < 5\} \ x := x * x \{x < 25\}}$$

#### Which Inferences Are Correct?

$$\frac{\{x > 0 \land x < 5\} \ x \ := \ x * x \{x < 25\}}{\{x = 3\} \ x \ := \ x * x \{x < 25\}} \ \textit{YES}$$

$$\frac{\{x=3\} \ x \ := \ x * x \{x < 25\}}{\{x > 0 \land x < 5\} \ x \ := \ x * x \{x < 25\}}$$

$$\frac{\{x * x < 25\} \ x := x * x \{x < 25\}}{\{x > 0 \land x < 5\} \ x := x * x \{x < 25\}}$$

#### Which Inferences Are Correct?

$$\frac{\{x > 0 \land x < 5\} \ x := x * x \{x < 25\}}{\{x = 3\} \ x := x * x \{x < 25\}} \ YES$$

$$\frac{\{x=3\}\ x\ :=\ x*x\ \{x<25\}}{\{x>0\land x<5\}\ x\ :=\ x*x\ \{x<25\}}\ \textit{NO}$$

$$\frac{\{x * x < 25\} \ x := x * x \{x < 25\}}{\{x > 0 \land x < 5\} \ x := x * x \{x < 25\}}$$

#### Which Inferences Are Correct?

$$\frac{\{x > 0 \land x < 5\} \ x \ := \ x * x \{x < 25\}}{\{x = 3\} \ x \ := \ x * x \{x < 25\}} \ \textit{YES}$$

$$\frac{\{x=3\} \ x \ := \ x * x \{x < 25\}}{\{x > 0 \land x < 5\} \ x \ := \ x * x \{x < 25\}} \ NO$$

$$\frac{\{x * x < 25\} \ x := x * x \{x < 25\}}{\{x > 0 \land x < 5\} \ x := x * x \{x < 25\}} \ YES$$

#### Post Condition Weakening

$$\frac{\{P\}\ C\ \{Q'\}\quad Q'\Rightarrow Q}{\{P\}\ C\ \{Q\}}$$

• Example:

$$\frac{\{x+y=5\} \ x := x+y \ \{x=5\} \quad (x=5) \Rightarrow (x<10)}{\{x+y=5\} \ x := x+y \ \{x<10\}}$$

## Rule of Consequence

# $\frac{P \Rightarrow P' \quad \{P'\} \ C \ \{Q'\} \quad Q' \Rightarrow Q}{\{P\} \ C \ \{Q\}}$

- Logically equivalent to the combination of Precondition Strengthening and Postcondition Weakening
- Uses  $P \Rightarrow P$  and  $Q \Rightarrow Q$

Sequencing

$$\frac{\{P\}\ C_1\ \{Q\}\quad \{Q\}\ C_2\ \{R\}}{\{P\}\ C_1;\ C_2\ \{R\}}$$

• Example:

#### If Then Else

$$\frac{\{P \land B\} \ C_1 \ \{Q\} \quad \{P \land \neg B\} \ C_2 \ \{Q\}\}}{\{P\} \ \textit{if} \ B \ \textit{then} \ C_1 \ \textit{else} \ C - 2 \ \{Q\}}$$

• Example:

$$\{y = a\}$$
 if  $x < 0$  then  $y := y - x$  else  $y := y + x$   $\{y = a + |x|\}$ 

By If\_Then\_Else Rule suffices to show:

• (1) 
$$\{y = a \land x < 0\}$$
  $y := y - x$   $\{y = a + |x|\}$  and

• (4) 
$$\{y = a \land \neg(x < 0)\}\ y := y + x \ \{y = a + |x|\}$$

 $(1) \{y = a \land x < 0\} \ y := y - x \{y = a + |x|\}$ 

(3) 
$$(y = a \land x < 0) \Rightarrow (y = a + |x|)$$
  
(2)  $\{y - x = a + |x|\} \ y := y - x \{y = a + |x|\}$   
(1)  $\{y = a \land x < 0\} \ y := y - x \{y = a + |x|\}$ 

- (1) reduces to (2) and (3) by Precondition Strengthening
- (2) instance of Assignment Axiom
- (3) holds since  $x < 0 \Rightarrow |x| = -x$

# (4) $\{y = a \land \neg(x < 0)\}\ y := y + x\ \{y = a + |x|\}$

(6) 
$$(y = a \land \neg(x < 0)) \Rightarrow (y + x = a + |x|)$$
  
(5)  $\{y + x = a + |x|\} y := y + x \{y = a + |x|\}$   
(4)  $\{y = a \land \neg(x < 0)\} y := y + x \{y = a + |x|\}$ 

- (4) reduces to (5) and (6) by Precondition Strengthening
- (5) Follows from Assignment Axiom
- (6) since  $\neg(x < 0) \Rightarrow |x| = x$

Elsa L Gunter () CS477

CS477 Formal Software Development Method

If Then Else

$$\begin{array}{c} \text{(1) } \{y = a \land x < 0\} \ y := y - x \ \{y = a + |x|\} \\ \text{(4) } \{y = a \land \neg(x < 0)\} \ y := y + x \ \{y = a + |x|\} \\ \hline \{y = a\} \ \textit{if} \ x < 0 \ \textit{then} \ y := y - x \ \textit{else} \ y := y + x \ \{y = a + |x|\} \end{array}$$

by the If\_Then\_Else Rule

# While

# We need a rule to be able to make assertions about while loops.

- Inference rule because we can only draw conclusions if we know something about the body
- Lets start with:

Elsa L Gunter (

CS477 Formal Software Development Method

While

- Loop may never execute
- To know P holds after, it had better hold before
- Second approximation:

$$\frac{\{?\}C\{?\}}{\{P\} \text{ while } B \text{ do } C\{P\}}$$

Elsa L Gunter

While

CS477 Formal Software Development Metho

# While

- Loop may execute C; enf of loop is of C
- ullet P holds at end of while means P holds at end of loop C
- P holds at start of *while*; loop taken means  $P \wedge B$  holds at start of C
- Third approximation:

$$\frac{\{P \land B\} \ C \ \{P\}}{\{P\} \ \textit{while B do C} \ \{P\}}$$

(ロ) (**a**) ) (言) (言) (言) (9)

• Always know  $\neg B$  when while loop finishes

• Final While rule:

 $\frac{\{\textit{P} \land \textit{B}\} \textit{ C} \{\textit{P}\}}{\{\textit{P}\} \textit{ while } \textit{B} \textit{ do } \textit{C} \{\textit{P} \land \neg \textit{B}\}}$ 

Elsa L Gunter ()

S477 Formal Software Development Method

1 + 4 m +

Elsa L Gunter

477 Formal Software Development Method

#### While

$$\frac{\{P \land B\} \ C \ \{P\}}{\{P\} \ \textit{while} \ B \ \textit{do} \ C \ \{P \land \neg B\}}$$

- P satisfying this rule is called a loop invariant
- Must hold before and after the each iteration of the loop

Elsa I Gunter (

CS477 Formal Software Development Method

#### While

- While rule generally used with precondition strengthening and postcondition weakening
- No algorithm for computing P in general
- Requires intuition and an understanding of why the program works

Elea I Guntar (

477 Formal Software Development Method

#### Example

Prove:

$${n \ge 0}$$
  
 $x := 0; y := 0;$   
while  $x < n$  do  
 $(y := y + ((2 * x) + 1);$   
 $x := x + 1)$   
 ${y = n * n}$ 

Elsa L Gunter (

S477 Formal Software Development Method

#### Example

 Need to find P that is true before and after loop is executed, such that

$$(P \land \neg(x < n)) \Rightarrow y = n * n$$

Elsa L Gunter (

CS477 Formal Software Development Metho

#### Example

• First attempt:

$$y = x * x$$

- Motivation:
- Want y = n \* n
- x counts up to n
- Guess: Each pass of loop calcuates next square

#### Example

By Post-condition Weakening, suffices to show:

(1) 
$$\{n \ge 0\}$$
  
 $x := 0; y := 0;$   
while  $x < n$  do  
 $\{y := y + ((2 * x) + 1); x := x + 1\}$   
 $\{y = x * x \land \neg(x < n)\}$ 

and

(2) 
$$(y = x * x \land \neg(x < n)) \Rightarrow (y = n * n)$$

Elsa L Gunter ()

S477 Formal Software Development Method

< □ > <**♂** > < 분 > < 분 > 및 **♡** Q(

Elsa L Gunter

477 Formal Software Development Method

#### Problem with (2)

- Want (2)  $(y = x * x \land \neg(x < n)) \Rightarrow (y = n * n)$
- From  $\neg(x < n)$  have  $x \ge n$
- Need x = n
- Don't know this; from this could have x > n
- Need stronger invariant
- Try ading  $x \le n$
- Then have  $((x \le n) \land \neg (x < n)) \Rightarrow (x = n)$
- Then have x = n when loop done

4 D > 4 🗗 >

a L Gunter ()

CS477 Formal Software Development Method

#### Example

Second attempt:

$$P = ((y = x * x) \land (x < n))$$

Again by Post-condition Weakening, sufices to show:

(1) 
$$\{n \ge 0\}$$
  
 $x := 0; y := 0;$   
while  $x < n$  do  
 $\{y := y + ((2 * x) + 1); x := x + 1\}$   
 $\{(y = x * x) \land (x \le n) \land \neg (x < n)\}$ 

and

$$(2) ((y = x * x) \land (x \le n) \land \neg (x < n)) \Rightarrow (y = n * n)$$

Isa I Gunter ()

S477 Formal Software Development Meth

**∄** ჟ৭৫

#### Proof of (2)

- $\bullet (\neg (x < n)) \Rightarrow (x \ge n)$
- $((x \ge n) \land (x \le n)) \Rightarrow (x = n)$
- $\bullet ((x = n) \land (y = x * x)) \Rightarrow (y = n * n)$

Elsa L Gunter (

CS477 Formal Software Development Meth

#### Example

- For (1), set up While Rule using Sequencing Rule
- By Sequencing Rule, suffices to show
- (3)  $\{n \ge 0\}$  x := 0; y := 0  $\{(y = x * x) \land (x \le n)\}$

and

(4) 
$$\{(y = x * x) \land (x \le n)\}$$
  
while  $x < n$  do  
 $(y := y + ((2 * x) + 1); x := x + 1)$   
 $\{(y = x * x) \land (x \le n) \land \neg (x < n)\}$ 

Elsa L Gunter (

S477 Formal Software Development Method

## Proof of (4)

By While Rule

(5) 
$$\{(y = x * x) \land (x \le n) \land (x < n)\}\$$
  
 $y := y + ((2 * x) + 1); \ x := x + 1$   
 $\{(y = x * x) \land (x \le n)\}\$   
 $\{(y = x * x) \land (x \le n)\}\$   
while  $x < n$  do  
 $(y := y + ((2 * x) + 1); \ x := x + 1)$   
 $\{(y = x * x) \land (x \le n) \land \neg (x < n)\}\$ 

Elsa L Gunter ()

S477 Formal Software Development Method

## Proof of (5)

By Sequencing Rule

$$\begin{array}{ll} (6) \ \{(y=x*x) \land (x \leq n) & (7) \ \{(y=(x+1)*(x+1)) \\ \land (x < n)\} & \land ((x+1) \leq n)\} \\ y:=y+((2*x)+1) & x:=x+1 \\ \{(y=(x+1)*(x+1)) & \{(y=x*x) \land (x \leq n)\} \\ \hline \land ((x+1) \leq n)\} \\ \hline \{(y=x*x) \land (x \leq n) \land (x < n)\} \\ y:=y+((2*x)+1); \ x:=x+1 \\ \{(y=x*x) \land (x \leq n)\} \end{array}$$

(7) holds by Assignment Axiom

4□ > 4∰ > 4 분 > 4 분 > 1 분 994(

Elsa L Gunter (

S477 Formal Software Development Method

#### Proof of (6)

By Precondition Strengthening

(8) 
$$((y = x * x)$$
  $= ((x + 1) * (x + 1))$   
 $(x \le n) \land (x < n)) \Rightarrow \land ((x + 1) \le n)$   
 $(((y + ((2 * x) + 1))$   $y := y + ((2 * x) + 1)$   
 $= (x + 1) * (x + 1))$   $\{(y = (x + 1) * (x + 1))$   
 $((x + 1) \le n))$   $((x + 1) \le n)\}$   

$$\{(y = x * x) \land (x \le n)$$

$$(x < n)\}$$

$$y := y + ((2 * x) + 1)$$

$$\{(y = (x + 1) * (x + 1))$$

$$((x + 1) \le n)\}$$

Have (9) by Assignment Axiom

Elsa L Gunter ()

#### Proof of (8)

- (Assuming x integer)  $(x < n) \Rightarrow ((x + 1) \le n)$
- $(y = x * x) \Rightarrow ((y + ((2 * x) + 1)))$ = ((x \* x) + ((2 \* x) + 1))= ((x + 1) \* (x + 1)))
- That finishes (8), and thus (6) and thus (5) and thus (4) (while)
- Need (3)  $\{n \ge 0\}$  x := 0; y := 0  $\{(y = x * x) \land (x \le n)\}$

#### Proof of (3)

By Sequencing

(10) 
$$\{n \ge 0\}$$
  $(11)$   $\{(0 = x * x) \land (x \le n)\}$   
 $x := 0$   $y := 0$   
 $\{(0 = x * x) \land (x \le n)\}$   $\{(y = x * x) \land (x \le n)\}$   
 $\{n \ge 0\} \ x := 0; \ y := 0 \ \{(y = x * x) \land (x \le n)\}$ 

Have (11) by Assignment Axiom

Proof of (10)

By Precondition Strengthening

$$(13) \quad \{(0 = 0 * 0) \land (0 \le n)\}$$

$$x := 0$$

$$(12) \quad (n \ge 0) \Rightarrow ((0 = 0 * 0) \land (0 \le n)) \qquad \{(0 = x * x) \land (x \le n)\}$$

$$\{n \ge 0\} \quad x := 0; \quad y := 0 \quad \{(0 = x * x) \land (x \le n)\}$$

- For (12), 0 = 0 \* 0 and  $(n \ge 0) \Leftrightarrow (0 \le n)$
- Have (13) by Assignment Axiom
- Finishes (10), thus (3), thus (1)
