## Vector Clock Size Lower Bound

Theorem: Any implementation of vector clocks using vectors of real numbers requires vectors of length $n$ (number of processes).
Proof: For any value of $n$, consider this execution:

$a_{i}$ : first send event at process $p_{i}$
$b_{i}$ : last receive event at $p_{i}$

## Example Bad Execution

For $n=4$ :

## Vector Clock Size Lower Bound

Claim 1: $a_{i+1}| | b_{i}$ for all $i$ (with wrap-around)
Proof: Since each proc. does all sends before any receives, there is no transitivity. Also $p_{i+1}$ does not send to $p_{i}$.

Claim 2: $a_{i+1} \rightarrow b_{j}$ for all $j \neq i$.
Proof: If $j=i+1$, obvious.
If $j \neq i+1$, then $p_{i+1}$ sends to $p_{j}$ :

## Vector Clock Size Lower Bound

$\square$ Suppose in contradiction, there is a way to implement vector clocks with $k$-vectors of reals, where $k<n$.
$\square$ By Claim 1, $a_{i+1}| | b_{i}$
$=>V\left(a_{i+1}\right)$ and $V\left(b_{i}\right)$ are incomparable
$=>V\left(a_{i+1}\right)$ is larger than $V\left(b_{i}\right)$ in some coordinate $h(i)$
$=>h:\{0, \ldots, n-1\} \rightarrow\{0, \ldots, k-1\}$

## Vector Clock Size Lower Bound

$\square$ Since $k<n$, the function $h$ is not 1-1. So there exist distinct $i$ and $j$ such that $h(i)=h(j)$. Let $r$ be this common value of $h$.

$$
\begin{aligned}
& \begin{array}{l}
V\left(a_{0}\right) \\
V\left(a_{1}\right) \\
\text { in comp. } h(0) \\
V \\
\left(b_{0}\right)
\end{array}
\end{aligned}
$$

$$
\begin{aligned}
& V\left(a_{n-1}\right) \geq \text { in comp. } h(n-2) V\left(b_{n-2}\right) \\
& >\text { in comp. } \mathrm{h}(n-1) \mathrm{V}\left(b_{n-1}\right)
\end{aligned}
$$

## Vector Clock Size Lower Bound

## Vector Clock Size Lower Bound

$\square$ So $V\left(a_{i+1}\right)$ is larger than $V\left(b_{i}\right)$ in coordinate $r$ and $V\left(a_{j+1}\right)$ is larger than $V\left(b_{j}\right)$ in coordinate $r$ also.
$\square V\left(a_{j+1}\right)[r]>V\left(b_{j}\right)[r]$ by def. of $r$

$$
\begin{aligned}
& \geq V\left(a_{i+1}\right)[r] \text { by Claim } 2\left(a_{i+1} \rightarrow b_{j}\right) \& \text { correct. } \\
& \geq V\left(b_{i}\right)[r] \text { by def. of } r
\end{aligned}
$$

$\square$ Thus $V\left(a_{j+1}\right)!<V\left(b_{i}\right)$, contradicting Claim $2\left(a_{j+1} \rightarrow b_{i}\right)$ and assumed correctness of $V$.
