- **Don't panic!**
- If you brought anything except your writing implements, your double-sided **handwritten** (in the original) 8½" × 11" cheat sheet, and your university ID, please put it away for the duration of the exam. In particular, please turn off and put away *all* medically unnecessary electronic devices.
 - Submit your cheat sheet together with your exam. An exam without your cheat sheet attached to it will not be graded.
 - If you are NOT using a cheat sheet, please indicate so in large friendly letters on this page.
- **Best answer.** Choose best possible choice if multiple options seems correct to you – for algorithms, faster is always better.
- Please ask for clarification if any question is unclear.
- **This exam lasts 170 minutes.**
- Fill your answers in the Scantron form using a pencil. We also recommend you circle/mark your answer in the exam booklet.
- Please return **all** paper with your answer booklet: your cheat sheet, and all scratch paper. We will **not** return the cheat sheet.
- Do not fill more than one answer on the Scantron form - such answers would not be graded. Also, fill your answer once you are sure of your answer – erasing an answer might make the form unscannable.
- **Good luck!**

Before doing the exam...

- Fill your name and netid in the back of the Scantron form, and also on the top of this page.
- **Fill in the pattern shown on the right in the Scantron form.**

95	Ⓐ	Ⓑ	Ⓒ	Ⓓ	●	
96	Ⓐ	Ⓑ	Ⓒ	Ⓓ	●	

This encodes which version of the exam you are taking, so that we can grade it.

1. (2 points) Consider the following decision problem: Given a directed graph G , and two vertices u, v in G , is there a path from u to v in G ?

This problem has a polynomial length certificate and polynomial time certifier. This claim is

- (A) True.
- (B) False.

2. (3 points) You are given a directed graph G with n vertices and m edges. Consider the problem of deciding if this graph has k vertices t_1, \dots, t_k , such that any vertex in G can reach any of these k vertices. This problem is

- (A) None of other answers are correct.
- (B) Doable in $O(n + m)$ time.
- (C) Doable in $O(n^k(n + m))$ time, and no faster algorithm is possible.
- (D) **NP-COMplete** by a reduction from Hamiltonian path/cycle to this problem.
- (E) **NP-COMplete** by a reduction from this problem to Hamiltonian path/cycle.

3. (2 points) Consider the language

$$L = \{1^i \mid i \geq 0, i \text{ is an integer, and } i \text{ is not divisible by } p_1, p_2, \dots, p_{100}\},$$

where p_j is the j th smallest prime number, for $j = 1, \dots, 100$ (i.e., $p_1 = 2, p_3 = 3, \dots, p_{100} = 541$). This language is

- (A) Regular.
- (B) Decidable.
- (C) Finite.
- (D) Context-free.
- (E) Undecidable.

4. (3 points) The number of undecidable languages is

- (A) None of the other answers are correct.
- (B) undecidable.
- (C) countable.
- (D) uncountable.
- (E) $2^{\mathbb{R}} = \aleph_2$.

5. (3 points) Let \mathcal{PC} be the class of all decision problems, for which there is a certifier that works in polynomial time in the length of the input and the length of the certificate, and furthermore, for an input of length n , if it is a YES instance, then there is a certificate that is a binary string of length $2^{O(n)}$. We have that:

- (A) All the problems in \mathcal{PC} can be solved in polynomial time.
- (B) None of the other answers is correct.
- (C) $\mathcal{PC} \subseteq \mathbf{NP}$.
- (D) $\mathbf{NP} \subseteq \mathcal{PC}$.

6. (5 points) A string $s \in \{a, b\}^*$ is γ -wild if $|\#(a, s) - \#(b, s)| > \gamma$, where γ is a prespecified parameter, and $\#(a, s)$ is the number of appearances of a in s . For a string $w \in \{a, b\}^*$ and parameters γ and τ , breaking it into strings s_1, s_2, \dots, s_ℓ is a (γ, τ) -breakup of w iff:

- (I) For all i , $s_i \in \{a, b\}^*$.
- (II) For all i , s_i is γ -wild.
- (III) $w = s_1 s_2 \dots s_\ell$ (that is, the concatenation of s_1, s_2, \dots, s_ℓ is w),
- (IV) $\ell \leq \tau$.

Given as input a string $w \in \{a, b\}^*$ of length m , and parameters γ and τ , an algorithm can decide if there is a (γ, τ) -breakup of w in (faster is better):

- (A) $O(m^3\gamma)$ time.
- (B) $O(m^3\tau)$ time.
- (C) $O(m^4)$.
- (D) $O(m^2\tau)$ time.
- (E) $O(m^2\gamma)$ time.

7. (3 points) You are given a directed graph G with n vertices, m edges, and positive weights on the vertices (but not on the edges). In addition, you are given two vertices u and v . The *weight* of a path π is the total weight of the vertices of π .

Consider the problem of computing the lightest (simple) path connecting a vertex u to a vertex v , that visits all the vertices of the graph. This problem is

- (A) Undecidable.
- (B) $\mathbf{NP-HARD}$.
- (C) Solvable in $O(n \log n + m)$ time.
- (D) Solvable in $O(n + m)$ time.
- (E) Polynomially equivalent to Eulerian cycle.

8. (3 points) You are given two algorithms A_Y and A_N . Both algorithms read an undirected graph G and a number k . If G has an independent set of size $\geq k$, then A_Y would stop (in polynomial time!) and output YES (if there is no such independent set then A_Y might run forever). Similarly, if G does not have an independent set of size $\geq k$, then the algorithm A_N would stop in polynomial time, and output NO (if there is such an independent set then A_N might run forever).

In such a scenario:

- (A) One can in polynomial time output if G has a an independent set of size $\geq k$.
- (B) This would imply that $P \neq NP$.
- (C) This would imply that $P = NP$.
- (D) At least two of the other answers are correct.
- (E) Impossible since $P \neq NP$.

9. (3 points) Give a CNF formula F with n variables, and m clauses, where every clause has exactly three literals (reminder: a literal is either a variable or its negation). Then, one can compute a satisfying assignment to F in:

- (A) This is **Satisfiability** and it can not be solved in polynomial time unless $P = NP$.
- (B) $O(n^2 + m^2)$ time.
- (C) $O(n \log n + m)$ time.
- (D) $O(2^n - 2^m)$ time.
- (E) $O(n + m)$ time.

10. (3 points) You are given a graph G , and vertices u and v . Such a pair vertices is **robustly connected**, if they remain connected, even if we remove any single vertex in G (except for u and v , naturally). Consider the problem of deciding if u and v are robustly connected.

- (A) The problem is **NP-HARD**.
- (B) This problem can be solved in polynomial time.

11. (3 points) Given an undirected graph G with n vertices and m edges, and a number k , deciding if G has a spanning tree with maximum degree k is

- (A) Can be done in $O(n \log n + m)$ time, and there is no faster algorithm.
- (B) Can be done in $O(n + m)$ time.
- (C) Can be done in $O((n + m) \log n)$ time, and there is no faster algorithm.
- (D) **NP-COMPLETE**.
- (E) Can be done in polynomial time.

12. (2 points) You are given a set $\mathcal{I} = \{I_1, I_2, \dots, I_n\}$ of n weighted intervals on the real line. Consider the problem of computing the maximum weight set $\mathcal{C} \subseteq \mathcal{I}$, such that every pair of intervals of \mathcal{C} intersect. This problem

- (A) Can be solved in polynomial time.
- (B) Can be solved in linear time by a greedy algorithm.
- (C) Undecidable.
- (D) NP-HARD.
- (E) NP-COMPLETE.

13. (3 points) Given an undirected graph G , with n vertices and m edges, consider the decision problem of determining if the vertices of G can be colored (legally) by 2 colors (i.e., no adjacent pair of vertices have the same color). This problem is:

- (A) Solvable in $O(n + m)$ time.
- (B) As hard as the independent set problem.
- (C) Can be solved in polynomial time.
- (D) NP-COMPLETE.
- (E) Undecidable.

14. (3 points) For the following recurrence (evaluated from top to bottom in this order):

$$f(i, j, k) = \begin{cases} 1 & i < 0 \text{ or } j < 0 \text{ or } k < 0 \\ f(i - 1, j, k) + 1 & i > j \text{ or } i > k \\ f(i, j - 1, k) + 2 & j > k \\ f(i - 1, j, k) + f(i, j - 1, k) + f(i, j, k - 1) & \text{otherwise.} \end{cases}$$

Assume that every arithmetic operation takes constant time (even if the numbers involved are large). Computing $f(n, \lfloor n/2 \rfloor, \lfloor n/4 \rfloor)$ can be done in (faster is better):

- (A) $O(n)$ time, by recursion.
- (B) $O(n \log n)$ time.
- (C) $O(n^3)$ time, using dynamic programming.
- (D) $O(n^2)$ time, using dynamic programming.
- (E) $O(2^n)$.

15. (3 points) For the language $L = \{a^n b^n \mid n \geq 0\}$, we have

- (A) $F = \{a^i b^i \mid i \geq 0\}$ is a fooling set for L .
 - (B) None of the sets suggested are fooling sets.
 - (C) $F = \{a^i b^j \mid i < j\}$ is a fooling set for L .
 - (D) All of the sets suggested are fooling sets.
 - (E) $F = \{a^i \mid i \geq 0\}$ is a fooling set for L .
-

16. (1 point) There are problems in **NP** that are solvable in linear time. This statement is

- (A) False.
 - (B) True.
-

17. (2 points) Consider a Turing machine (i.e., program) M that uses only a constant amount of memory in addition to its input. Then the language of $L(M)$ is

- (A) regular.
 - (B) not well defined.
 - (C) undecidable.
 - (D) context-free.
 - (E) finite.
-

18. (3 points) Given k sorted arrays A_1, A_2, \dots, A_k with a total of n numbers stored in them (all numbers are distinct). Given a number x , one can compute the smallest number y , in these arrays, that is larger than x , in (faster is better)

- (A) $O(n \log n)$ time.
 - (B) $O(nk)$ time.
 - (C) $O(n^2)$ time.
 - (D) $O(n)$ time.
 - (E) $O(k \log n)$ time.
-

19. (3 points) If a problem is undecidable, then it can also be **NP-HARD**. This statement is

- (A) False.
- (B) True.
- (C) None of the other answers.
- (D) False if $P = NP$.
- (E) True if $P = NP$.

20. (3 points) Given an array $B[1 \dots n]$ with n real numbers (B is not sorted), consider the problem computing and printing out the smallest $\lfloor \sqrt{n} \rfloor$ numbers in B – the numbers should be output in sorted order. This can be done in

- (A) $O(n)$ time, and no faster algorithm is possible.
 - (B) $O(\sqrt{n} \log n)$ time, and no faster algorithm is possible.
 - (C) $O(\sqrt{n} \log^2 n)$ time, and no faster algorithm is possible.
 - (D) $O(n \log n)$ time, and no faster algorithm is possible.
-

21. (3 points) You are given an NFA N with n states (N might have ε -transitions), and with the input alphabet being $\Sigma = \{0, 1\}$. Given a binary string $w \in \Sigma^*$ of length m , one can simulate N on a regular computer and decide if $w \notin L(N)$. Which of the following is correct?

- (A) This can be done in $O(n^2 m)$ time.
 - (B) This can be done in $O(2^n m)$ time, and no faster algorithm is possible.
 - (C) This can be done in $O(n^m)$ time, and no faster algorithm is possible.
 - (D) None of the other answers is correct.
 - (E) This problem can not be done in polynomial time, because it is undecidable.
-

22. (3 points) Let B be the problem of deciding if the shortest path in a graph between two given vertices is smaller than some parameter k (where the weights on the edges of the graph are positive). Let C be the problem of deciding if a given CNF formula is satisfiable. Pick the correct answer out of the following:

- (A) There is a polynomial time reduction from C to B , but only if $P \neq NP$.
 - (B) There is no relation between the two problems, and no reduction is possible.
 - (C) None of the other answers is correct.
 - (D) There is a polynomial time reduction from B to C .
 - (E) There is a polynomial time reduction from B to C , but only if $P = NP$.
-

23. (3 points) You are given a graph G with n vertices and $m = O(n)$ edges, and with weights on the edges. In addition, you are given the MST tree T of G .

Next, you are informed that the price of some edge e in the MST T had changed from its current cost (either increased or decreased), to a new cost α . Deciding if T is still the MST of the graph with the updated weights can be done in (faster is better):

- (A) $O(1)$ time.
- (B) $O(\log n)$ time, after preprocessing the graph in $O(n)$ time.
- (C) $O(n)$ time.
- (D) $O(nm)$ time algorithm, and no faster algorithm is possible.
- (E) $O(n \log n + m)$ time.

24. (3 points) Let P_1, \dots, P_{k+1} be $k+1$ decision problems. Consider a sequence of k polynomial reductions R_1, \dots, R_k , where R_i works in quadratic time in its input size, and is a reduction from P_i to P_{i+1} . As such, there is a reduction from P_1 to P_{k+1} and its running time is

- (A) $O(k^2n^2)$
- (B) $O(n^{2k})$
- (C) $O(n^{2^k})$
- (D) $O(kn^2)$
- (E) $O(2^kn^2)$

25. (3 points) Consider a CNF formula F with m clauses. In F there are at most \sqrt{m} clauses of size 3, and the rest are clauses of size 2. Deciding if such a formula is satisfiable is

- (A) Can be solved in linear time.
- (B) None of the other answers are correct.
- (C) **NP-COMplete**.
- (D) Can not be solved in linear time, but can be done in polynomial time.

26. (3 points) Consider the problem of checking if a graph has k vertices that are all adjacent to each other. This problem can be solved in

- (A) None of the other answers are correct.
- (B) It is **NP-COMplete**, so it can not be solved efficiently.
- (C) Polynomial time.
- (D) Maybe polynomial time – we do not know. Currently fastest algorithm known takes exponential time.

27. (2 points) For a word $w = w_1w_2 \dots w_m$, with $w_i \in \{0, 1\}^*$, let $w^S = w_3w_4 \dots w_{m-1}w_mw_1w_2$. If a language L is a regular language, then the language $L^S = \{w^S \mid w \in L\}$ is regular.

- (A) True
- (B) False

28. (2 points) Consider a DFA M with m states defined over $\{0, 1\}^*$. There is an equivalent regular expression r (i.e., $L(r) = L(N)$), such that (tighter is better):

- (A) r is of length at most $O(m \log m)$.
- (B) r is of length at most $O(m)$.
- (C) r is of length at most $f(m)$, where f is some function that is not specified in the other answers.
- (D) none of other answers.

-
- 29.** (2 points) You are given an undirected graph G with n vertices and m edges, and a pair of vertices u, v . Deciding if u and v are in the same connected component of G can be done in
- (A) None of the other answers is correct.
 - (B) $O(nm)$ time using Bellman-Ford.
 - (C) $O(n + m)$ time.
 - (D) $O(n \log n + m)$ time.
 - (E) only exponential time since this problem is **NP-COMplete**.
-

- 30.** (3 points) You are given a directed graph G with n vertices and m edges. Consider the problem of deciding if there is a closed walk (the walk is allowed to repeat both vertices and edges) that visits all the vertices of G .
- (A) This problem is **NP-COMplete**.
 - (B) This problem is **NP-HARD**.
 - (C) This problem can be solved in $O(n + m)$ time.
 - (D) This problem can be solved in $O(nm)$ time, and no faster algorithm is possible.
 - (E) All of the other answers are correct.
-

- 31.** (2 points) You are given an unsorted set Y of m numbers. Deciding if there are two numbers x and y in Y such that $xy = 1$ can be solved in (faster is better):
- (A) $O(m^{3/2})$ time.
 - (B) $O(m^2)$ time.
 - (C) $O(m^2 \log m)$ time.
 - (D) $O(m \log m)$ time.
 - (E) $O(m)$ time.
-

- 32.** (3 points) Given two DFAs N_1 and N_2 with n_1 and n_2 states, respectively. Then there is a DFA M that accepts the language $L(N_1) \oplus L(N_2)$, where $A \oplus B = (A \setminus B) \cup (B \setminus A)$.
- (A) True, and the number of states of M is at most $2^{n_1} 2^{n_2}$.
 - (B) False.
 - (C) True, and the number of states of M is at most $n_1 n_2$.
 - (D) True, and the number of states of M is at most $O(n_1 + n_2)$.
 - (E) None of the other answers is correct.

33. (3 points) For a text file T , let $\langle T \rangle$ denote the string that is the content of T . Consider the language

$$L = \{ \langle T \rangle \mid T \text{ is a java program that stops on some input} \}.$$

This language is

- (A) Decidable.
- (B) Undecidable.
- (C) None of the other answers.
- (D) Context-free.
- (E) Regular.

34. (3 points) Let G be a directed graph with weights (which can be either positive or negative). The graph G has n vertices and m edges. Computing the *longest simple* path between two vertices in G can be done in:

- (A) This can be solved in $O(n \log n + m)$ time using Dijkstra.
- (B) This can be solved in $O(nm)$ time using Bellman-Ford.
- (C) This is not defined if there are negative cycles in the graph. As such, it can not be computed.
- (D) None of the above.
- (E) This is **NP-HARD**.

35. (3 points) Let $L \subseteq \Sigma^*$ be a context-free language. Then the complement language \bar{L} is always context-free.

- (A) None of the other answers.
- (B) True.
- (C) True if the language L is decidable.
- (D) False.
- (E) True if the language L is undecidable.

36. (3 points) Consider the recurrence $f(n) = f(\lfloor (2/3)n \rfloor) + f(\lfloor (1/3)n \rfloor) + O(n)$, where $f(n) = O(1)$ if $n < 10$. The solution to this recurrence is

- (A) $O(n \log n)$.
- (B) $O(1)$.
- (C) None of the above.
- (D) $O(n)$.
- (E) $O(n^2)$.
