This is the last homework before Midterm 1.

1. Describe context-free grammars for the following languages over the alphabet \( \Sigma = \{0, 1\} \). For each non-terminal in your grammars, describe in English the language generated by that non-terminal.

   (a) \( \{0^m 1^n \mid m > n\} \)

   (b) The set of all palindromes in \((0 + 1)^*\) whose length is divisible by 7.

   (c) \( \{0^a 1^b \mid a \neq 2b \text{ and } b \neq 2a\} \)

   [Hint: You proved that the first two languages are non-regular in HW2.1(a) and HW2.1(c). The language described in HW2.1(b) is not even context-free!]

2. For any string \( w \), let \( \text{contract}(w) \) denote the string obtained by collapsing each maximal substring of equal symbols to one symbol. For example:

   \[
   \begin{align*}
   \text{contract}(010101) &= 010101 \\
   \text{contract}(001110) &= 010 \\
   \text{contract}(111111) &= 1 \\
   \text{contract}(1) &= 1 \\
   \text{contract}(\epsilon) &= \epsilon
   \end{align*}
   \]

   Prove that for every regular language \( L \) over the alphabet \( \{0, 1\} \), the following languages are also regular:

   (a) \( \text{contract}(L) = \{\text{contract}(w) \mid w \in L\} \)

   (b) \( \text{contract}^{-1}(L) = \{w \in \{0, 1\}^* \mid \text{contract}(w) \in L\} \)

3. For any string \( w \), let \( \text{oneswap}(w) \) be the set of all strings obtained by swapping exactly one pair of adjacent symbols in \( w \). For example:

   \[
   \begin{align*}
   \text{oneswap}(010101) &= \{100101, 001101, 011001, 010011, 010110\} \\
   \text{oneswap}(001110) &= \{001110, 010110, 001101\} \\
   \text{oneswap}(111111) &= \{111111\} \\
   \text{oneswap}(1) &= \emptyset \\
   \text{oneswap}(\epsilon) &= \emptyset
   \end{align*}
   \]

   For any language \( L \), define a new language \( \text{oneswap}(L) \) as follows:

   \[
   \text{oneswap}(L) := \bigcup_{w \in L} \text{oneswap}(w)
   \]

   Prove that if \( L \) is a regular language over the alphabet \( \{0, 1\} \), the language \( \text{oneswap}(L) \) is also regular.
Solved problem

4. (a) Fix an arbitrary regular language \( L \). Prove that the language \( \text{half}(L) := \{ w \mid ww \in L \} \) is also regular.

**Solution:** Let \( M = (\Sigma, Q, s, A, \delta) \) be an arbitrary DFA that accepts \( L \). We define a new NFA \( M' = (\Sigma, Q', s', A', \delta') \) with \( \epsilon \)-transitions that accepts \( \text{half}(L) \), as follows:

\[
Q' = (Q \times Q \times Q) \cup \{ s' \}
\]

\( s' \) is an explicit state in \( Q' \)

\[ A' = \{(h, h, q) \mid h \in Q \text{ and } q \in A \} \]

\[
\delta'(s', \epsilon) = \{(s, h, h) \mid h \in Q \}
\]

\[
\delta'(s', a) = \emptyset
\]

\[
\delta'((p, h, q), \epsilon) = \emptyset
\]

\[
\delta'((p, h, q), a) = \{ (\delta(p, a), h, \delta(q, a)) \}
\]

\( M' \) reads its input string \( w \) and simulates \( M \) reading the input string \( ww \). Specifically, \( M' \) simultaneously simulates two copies of \( M \), one reading the left half of \( ww \) starting at the usual start state \( s \), and the other reading the right half of \( ww \) starting at some intermediate state \( h \).

- The new start state \( s' \) non-deterministically guesses the “halfway” state \( h = \delta^*(s, w) \) without reading any input; this is the only non-determinism in \( M' \).
- State \((p, h, q)\) means the following:
  - The left copy of \( M \) (which started at state \( s \)) is now in state \( p \).
  - The initial guess for the halfway state is \( h \).
  - The right copy of \( M \) (which started at state \( h \)) is now in state \( q \).

- \( M' \) accepts if and only if the left copy of \( M \) ends at state \( h \) (so the initial non-deterministic guess \( h = \delta^*(s, w) \) was correct) and the right copy of \( M \) ends in an accepting state.

**Solution (smartass):** A complete solution is given in the lecture notes.

**Rubric:** 5 points: standard language transformation rubric (scaled). Yes, the smartass solution would be worth full credit.
(b) Describe a regular language $L$ such that the language $\text{double}(L) := \{ww \mid w \in L\}$ is not regular. Prove your answer is correct.

**Solution:** Consider the regular language $L = \varepsilon \cdot 1$.

Expanding the regular expression lets us rewrite $L = \{\varepsilon \cdot 1^n \mid n \geq 0\}$. It follows that $\text{double}(L) = \{\varepsilon \cdot 1^n \cdot \varepsilon \cdot 1^n \mid n \geq 0\}$. I claim that this language is not regular.

Let $x$ and $y$ be arbitrary distinct strings in $L$.

Then $x = \varepsilon \cdot 1^i$ and $y = \varepsilon \cdot 1^j$ for some integers $i \neq j$.

Then $x$ is a distinguishing suffix of these two strings, because

- $xx \in \text{double}(L)$ by definition, but
- $yx = \varepsilon \cdot 1^i \cdot \varepsilon \cdot 1^j \notin \text{double}(L)$ because $i \neq j$.

We conclude that $L$ is a fooling set for $\text{double}(L)$.

Because $L$ is infinite, $\text{double}(L)$ cannot be regular. ■

**Solution:** Consider the regular language $L = \Sigma^* = (0 + 1)^*$.

I claim that the language $\text{double}(\Sigma^*) = \{ww \mid w \in \Sigma^*\}$ is not regular.

Let $F$ be the infinite language $01^*0$.

Let $x$ and $y$ be arbitrary distinct strings in $F$.

Then $x = 01^i0$ and $y = 01^j0$ for some integers $i \neq j$.

The string $z = 1^i$ is a distinguishing suffix of these two strings, because

- $xz = 01^i1^i = ww$ where $w = 01^i$, so $xz \in \text{double}(\Sigma^*)$, but
- $yz = 01^i1^j \notin \text{double}(\Sigma^*)$ because $i \neq j$.

We conclude that $F$ is a fooling set for $\text{double}(\Sigma^*)$.

Because $F$ is infinite, $\text{double}(\Sigma^*)$ cannot be regular. ■

**Rubric:** 5 points:

- 2 points for describing a regular language $L$ such that $\text{double}(L)$ is not regular.
- 1 point for describing an infinite fooling set for $\text{double}(L)$:
  - $\frac{1}{2}$ for explicitly describing the proposed fooling set $F$.
  - $\frac{1}{2}$ if the proposed set $F$ is actually a fooling set.
    - No credit for the proof if the proposed set is not a fooling set.
    - No credit for the problem if the proposed set is finite.
- 2 points for the proof:
  - $\frac{1}{2}$ for correctly considering arbitrary strings $x$ and $y$
    - No credit for the proof unless both $x$ and $y$ are always in $F$.
    - No credit for the proof unless both $x$ and $y$ can be any string in $F$.
  - $\frac{1}{2}$ for correctly stating a suffix $z$ that distinguishes $x$ and $y$.
  - $\frac{1}{2}$ for proving either $xz \in L$ or $yz \in L$.
  - $\frac{1}{2}$ for proving either $yz \notin L$ or $xz \notin L$, respectively.

These are not the only correct solutions. These are not the only fooling sets for these languages.
Standard language transformation rubric. For problems worth 10 points:

+ 2 for a formal, complete, and unambiguous description of the output automaton, including the states, the start state, the accepting states, and the transition function, as functions of an arbitrary input DFA. The description must state whether the output automaton is a DFA, an NFA without ϵ-transitions, or an NFA with ϵ-transitions.
  • No points for the rest of the problem if this is missing.

+ 2 for a brief English explanation of the output automaton. We explicitly do not want a formal proof of correctness, or an English transcription, but a few sentences explaining how your machine works and justifying its correctness. What is the overall idea? What do the states represent? What is the transition function doing? Why these accepting states?
  • Deadly Sin: No points for the rest of the problem if this is missing.

+ 6 for correctness
  • 3 for accepting all strings in the target language
  • 3 for accepting only strings in the target language
  • 1 for a single mistake in the formal description (for example a typo)
  • Double-check correctness when the input language is ∅, or {ϵ}, or 0∗, or Σ∗.
