Depth First Search (DFS)

Lecture 16
Thursday, March 14, 2019
Today

Two topics:

- Structure of directed graphs
- **DFS** and its properties
- One application of **DFS** to obtain fast algorithms
Part I

Strong connected components
Strong Connected Components (SCCs)

Algorithmic Problem
Find all SCCs of a given directed graph.

Previous lecture:
Saw an $O(n \cdot (n + m))$ time algorithm.
This lecture: sketch of a $O(n + m)$ time algorithm.
Graph of SCCs

Meta-graph of SCCs

Let $S_1, S_2, \ldots, S_k$ be the strong connected components (i.e., SCCs) of $G$. The graph of SCCs is $G^{SCC}$

1. Vertices are $S_1, S_2, \ldots, S_k$
2. There is an edge $(S_i, S_j)$ if there is some $u \in S_i$ and $v \in S_j$ such that $(u, v)$ is an edge in $G$. 
Proposition

For any graph $G$, the graph of SCCs of $G^{rev}$ is the same as the reversal of $G^{SCC}$.

Proof.

Exercise.
**Proposition**

For any graph $G$, the graph $G^{\text{SCC}}$ has no directed cycle.

**Proof.**

If $G^{\text{SCC}}$ has a cycle $S_1, S_2, \ldots, S_k$ then $S_1 \cup S_2 \cup \cdots \cup S_k$ should be in the same SCC in $G$. Formal details: exercise.
Part II

Directed Acyclic Graphs
Definition

A directed graph \( G \) is a **directed acyclic graph** (DAG) if there is no directed cycle in \( G \).
Is this a DAG?
Is this a DAG?
Sources and Sinks

Definition

1. A vertex $u$ is a **source** if it has no in-coming edges.
2. A vertex $u$ is a **sink** if it has no out-going edges.
Simple DAG Properties

Proposition

*Every DAG* $G$ *has at least one source and at least one sink.*

Proof.
Let $P = v_1, v_2, ..., v_k$ be a longest path in $G$. Claim that $v_1$ is a source and $v_k$ is a sink. Suppose not. Then $v_1$ has an incoming edge which either creates a cycle or a longer path both of which are contradictions. Similarly if $v_k$ has an outgoing edge.

1. $G$ is a DAG if and only if $G$ rev is a DAG.
2. $G$ is a DAG if and only each node is in its own strong connected component.

Formal proofs: exercise.
Proposition

Every DAG $G$ has at least one source and at least one sink.

Proof.

Let $P = v_1, v_2, \ldots, v_k$ be a longest path in $G$. Claim that $v_1$ is a source and $v_k$ is a sink. Suppose not. Then $v_1$ has an incoming edge which either creates a cycle or a longer path both of which are contradictions. Similarly if $v_k$ has an outgoing edge.
Simple DAG Properties

Proposition

Every DAG $G$ has at least one source and at least one sink.

Proof.

Let $P = v_1, v_2, \ldots, v_k$ be a longest path in $G$. Claim that $v_1$ is a source and $v_k$ is a sink. Suppose not. Then $v_1$ has an incoming edge which either creates a cycle or a longer path both of which are contradictions. Similarly if $v_k$ has an outgoing edge.

1. $G$ is a DAG if and only if $G^{\text{rev}}$ is a DAG.
2. $G$ is a DAG if and only if each node is in its own strong connected component.

Formal proofs: exercise.
### Definition

A **topological ordering/topological sorting** of $G = (V, E)$ is an ordering $\prec$ on $V$ such that if $(u, v) \in E$ then $u \prec v$.

### Informal equivalent definition:

One can order the vertices of the graph along a line (say the $x$-axis) such that all edges are from left to right.
A directed graph $G$ can be topologically ordered iff it is a DAG.

Need to show both directions.
A directed graph $G$ can be topologically ordered if it is a DAG.
Lemma

A directed graph $G$ can be topologically ordered if it is a DAG.

Proof.

Consider the following algorithm:

1. Pick a source $u$, output it.
2. Remove $u$ and all edges out of $u$.
3. Repeat until graph is empty.

Exercise: prove this gives topological sort.
Lemma

A directed graph $G$ can be topologically ordered if it is a DAG.

Proof.

Consider the following algorithm:

1. Pick a source $u$, output it.
2. Remove $u$ and all edges out of $u$.
3. Repeat until graph is empty.

Exercise: prove this gives topological sort.

Exercise: show algorithm can be implemented in $O(m + n)$ time.
Topological Sort: Example

```
a -> d -> f -> c -> b -> e -> g -> h
```
DAGs and Topological Sort

Lemma

A directed graph $G$ can be topologically ordered only if it is a DAG.
Lemma

A directed graph $G$ can be topologically ordered only if it is a DAG.

Proof.

Suppose $G$ is not a DAG and has a topological ordering $\prec$. $G$ has a cycle $C = u_1, u_2, \ldots, u_k, u_1$. Then $u_1 \prec u_2 \prec \ldots \prec u_k \prec u_1!$

That is... $u_1 \prec u_1$. A contradiction (to $\prec$ being an order). Not possible to topologically order the vertices.
Note: A DAG $G$ may have many different topological sorts.

Question: What is a DAG with the most number of distinct topological sorts for a given number $n$ of vertices?

Question: What is a DAG with the least number of distinct topological sorts for a given number $n$ of vertices?
**Question**: Given an *undirected* graph how do we check whether it has a cycle and output one if it has one?

**Question**: Given an *directed* graph how do we check whether it has a cycle and output one if it has one?
To Remember: Structure of Graphs

**Undirected graph:** connected components of \( G = (V, E) \) partition \( V \) and can be computed in \( O(m + n) \) time.

**Directed graph:** the meta-graph \( G^{SCC} \) of \( G \) can be computed in \( O(m + n) \) time. \( G^{SCC} \) gives information on the partition of \( V \) into strong connected components and how they form a DAG structure.

Above structural decomposition will be useful in several algorithms
Part III

Depth First Search (DFS)
Depth First Search

1. **DFS** special case of Basic Search.
2. **DFS** is useful in understanding graph structure.
3. **DFS** used to obtain linear time \( O(m + n) \) algorithms for
   1. Finding cut-edges and cut-vertices of undirected graphs
   2. Finding strong connected components of directed graphs
   3. Linear time algorithm for testing whether a graph is planar
4. ...many other applications as well.
### DFS in Undirected Graphs

Recursive version. Easier to understand some properties.

**DFS(G)**

<table>
<thead>
<tr>
<th>for all ( u \in V(G) ) do</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mark ( u ) as unvisited</td>
</tr>
<tr>
<td>Set ( \text{pred}(u) ) to null</td>
</tr>
<tr>
<td>( T ) is set to ( \emptyset )</td>
</tr>
<tr>
<td>while ( \exists ) unvisited ( u ) do</td>
</tr>
<tr>
<td>( \text{DFS}(u) )</td>
</tr>
</tbody>
</table>

**Output** \( T \)

**DFS(u)**

- Mark \( u \) as visited
- for each \( uv \) in \( \text{Out}(u) \) do
  - if \( v \) is not visited then
    - add edge \( uv \) to \( T \)
    - set \( \text{pred}(v) \) to \( u \)
    - \( \text{DFS}(v) \)

Implemented using a global array \( \text{Visited} \) for all recursive calls. \( T \) is the search tree/forest.
Edges classified into two types: $uv \in E$ is a

1. **tree edge**: belongs to $T$
2. **non-tree edge**: does not belong to $T$
Properties of DFS tree

Proposition

1. $T$ is a forest
2. connected components of $T$ are same as those of $G$.
3. If $uv \in E$ is a non-tree edge then, in $T$, either:
   1. $u$ is an ancestor of $v$, or
   2. $v$ is an ancestor of $u$.

Question: Why are there no cross-edges?
DFS with Visit Times

Keep track of when nodes are visited.

<table>
<thead>
<tr>
<th>DFS($G$)</th>
<th>DFS($u$)</th>
</tr>
</thead>
<tbody>
<tr>
<td>for all $u \in V(G)$ do</td>
<td></td>
</tr>
<tr>
<td>Mark $u$ as unvisited</td>
<td></td>
</tr>
<tr>
<td>$T$ is set to $\emptyset$</td>
<td></td>
</tr>
<tr>
<td>$time = 0$</td>
<td></td>
</tr>
<tr>
<td>while $\exists$ unvisited $u$ do</td>
<td></td>
</tr>
<tr>
<td>DFS($u$)</td>
<td></td>
</tr>
<tr>
<td>Output $T$</td>
<td></td>
</tr>
<tr>
<td>Mark $u$ as visited</td>
<td></td>
</tr>
<tr>
<td>$pre(u) = ++time$</td>
<td></td>
</tr>
<tr>
<td>for each $uv$ in $Out(u)$ do</td>
<td></td>
</tr>
<tr>
<td>if $v$ is not marked then</td>
<td></td>
</tr>
<tr>
<td>add edge $uv$ to $T$</td>
<td></td>
</tr>
<tr>
<td>DFS($v$)</td>

<td>[4, ]</td>
</tr>
<tr>
<td>6</td>
<td>[5, 6]</td>
</tr>
</tbody>
</table>

\[
\begin{array}{c}
1 \quad 2 \quad 3 \quad 4 \quad 5 \quad 6 \\
\end{array}
\begin{array}{c}
7 \quad 8 \quad 9 \quad 10 \\
\end{array}
\]

\[
\begin{array}{c}
1 \quad 2 \quad 3 \quad 4 \quad 5 \quad 6 \\
\end{array}
\begin{array}{c}
7 \quad 8 \quad 9 \quad 10 \\
\end{array}
\]
### Example

**Vertex**: $[pre, post]$

<table>
<thead>
<tr>
<th>vertex</th>
<th>[pre, post]</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>[1, ]</td>
</tr>
<tr>
<td>2</td>
<td>[2, ]</td>
</tr>
<tr>
<td>4</td>
<td>[3, ]</td>
</tr>
<tr>
<td>5</td>
<td>[4, ]</td>
</tr>
<tr>
<td>6</td>
<td>[5, 6]</td>
</tr>
<tr>
<td>3</td>
<td>[7, ]</td>
</tr>
</tbody>
</table>
### Example

The vertex numbers are labeled with their corresponding \([\text{pre}, \text{post}]\) values:

<table>
<thead>
<tr>
<th>vertex</th>
<th>[\text{pre}, \text{post}]</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>[1, ]</td>
</tr>
<tr>
<td>2</td>
<td>[2, ]</td>
</tr>
<tr>
<td>4</td>
<td>[3, ]</td>
</tr>
<tr>
<td>5</td>
<td>[4, ]</td>
</tr>
<tr>
<td>6</td>
<td>[5, 6]</td>
</tr>
<tr>
<td>3</td>
<td>[7, ]</td>
</tr>
<tr>
<td>7</td>
<td>[8, ]</td>
</tr>
</tbody>
</table>
Example

<table>
<thead>
<tr>
<th>vertex</th>
<th>([pre, post])</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>([1, )</td>
</tr>
<tr>
<td>2</td>
<td>([2, )</td>
</tr>
<tr>
<td>4</td>
<td>([3, )</td>
</tr>
<tr>
<td>5</td>
<td>([4, )</td>
</tr>
<tr>
<td>6</td>
<td>([5, 6])</td>
</tr>
<tr>
<td>3</td>
<td>([7, )</td>
</tr>
<tr>
<td>7</td>
<td>([8, )</td>
</tr>
<tr>
<td>8</td>
<td>([9, )</td>
</tr>
</tbody>
</table>
Example

vertex | \([pre, post]\)
---|---
1  | [1, ]
2  | [2, ]
4  | [3, ]
5  | [4, ]
6  | [5, 6]
3  | [7, ]
7  | [8, ]
8  | [9, 10]
Example

<table>
<thead>
<tr>
<th>vertex</th>
<th>[pre, post]</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>[1, ]</td>
</tr>
<tr>
<td>2</td>
<td>[2, ]</td>
</tr>
<tr>
<td>4</td>
<td>[3, ]</td>
</tr>
<tr>
<td>5</td>
<td>[4, ]</td>
</tr>
<tr>
<td>6</td>
<td>[5, 6]</td>
</tr>
<tr>
<td>3</td>
<td>[7, ]</td>
</tr>
<tr>
<td>7</td>
<td>[8, 11]</td>
</tr>
<tr>
<td>8</td>
<td>[9, 10]</td>
</tr>
</tbody>
</table>
Example

<table>

DFS Properties

Generalizing ideas from undirected graphs:

1. \texttt{DFS}(G) takes \(O(m + n)\) time.
DFS Properties

Generalizing ideas from undirected graphs:

1. \( \text{DFS}(G) \) takes \( O(m + n) \) time.

2. Edges added form a branching: a forest of out-trees. Output of \( \text{DFS}(G) \) depends on the order in which vertices are considered.
DFS Properties

Generalizing ideas from undirected graphs:

1. $\text{DFS}(G)$ takes $O(m + n)$ time.

2. Edges added form a branching: a forest of out-trees. Output of $\text{DFS}(G)$ depends on the order in which vertices are considered.

3. If $u$ is the first vertex considered by $\text{DFS}(G)$ then $\text{DFS}(u)$ outputs a directed out-tree $T$ rooted at $u$ and a vertex $v$ is in $T$ if and only if $v \in \text{rch}(u)$.
DFS Properties

Generalizing ideas from undirected graphs:

1. **DFS**($G$) takes $O(m + n)$ time.

2. Edges added form a *branching*: a forest of out-trees. Output of **DFS**($G$) depends on the order in which vertices are considered.

3. If $u$ is the first vertex considered by **DFS**($G$) then **DFS**($u$) outputs a directed out-tree $T$ rooted at $u$ and a vertex $v$ is in $T$ if and only if $v \in rch(u)$

4. For any two vertices $x, y$ the intervals $[\text{pre}(x), \text{post}(x)]$ and $[\text{pre}(y), \text{post}(y)]$ are either disjoint or one is contained in the other.
DFS Properties

Generalizing ideas from undirected graphs:

1. $\text{DFS}(G)$ takes $O(m + n)$ time.
2. Edges added form a *branching*: a forest of out-trees. Output of $\text{DFS}(G)$ depends on the order in which vertices are considered.
3. If $u$ is the first vertex considered by $\text{DFS}(G)$ then $\text{DFS}(u)$ outputs a directed out-tree $T$ rooted at $u$ and a vertex $v$ is in $T$ if and only if $v \in \text{rch}(u)$
4. For any two vertices $x, y$ the intervals $[\text{pre}(x), \text{post}(x)]$ and $[\text{pre}(y), \text{post}(y)]$ are either disjoint or one is contained in the other.

Note: Not obvious whether $\text{DFS}(G)$ is useful in directed graphs but it is.
DFS Tree

Edges of $G$ can be classified with respect to the DFS tree $T$ as:

1. **Tree edges** that belong to $T$

2. A **forward edge** is a non-tree edges $(x, y)$ such that
   $\text{pre}(x) < \text{pre}(y) < \text{post}(y) < \text{post}(x)$.

3. A **backward edge** is a non-tree edge $(y, x)$ such that
   $\text{pre}(x) < \text{pre}(y) < \text{post}(y) < \text{post}(x)$.

4. A **cross edge** is a non-tree edges $(x, y)$ such that the intervals
   $[\text{pre}(x), \text{post}(x)]$ and $[\text{pre}(y), \text{post}(y)]$ are disjoint.
Types of Edges

Backward

Forward

Cross
Cycles in graphs

**Question:** Given an *undirected* graph how do we check whether it has a cycle and output one if it has one?

**Question:** Given an *directed* graph how do we check whether it has a cycle and output one if it has one?
Using DFS...

... to check for Acyclicity and compute Topological Ordering

Question

Given $G$, is it a DAG? If it is, generate a topological sort. Else output a cycle $C$. 

DFS based algorithm:

1. Compute $\text{DFS}(G)$
2. If there is a back edge $(v, u)$ then $G$ is not a DAG. Output cycle $C$ formed by path from $u$ to $v$ in $T$ plus edge $(v, u)$.
3. Otherwise output nodes in decreasing post-visit order.

Note: no need to sort, $\text{DFS}(G)$ can output nodes in this order.

Algorithm runs in $O(n + m)$ time.

Correctness is not so obvious. See next two propositions.
Using DFS...
... to check for Acyclicility and compute Topological Ordering

**Question**
Given $G$, is it a **DAG**? If it is, generate a topological sort. Else output a cycle $C$.

**DFS** based algorithm:
1. Compute $\text{DFS}(G)$
2. If there is a back edge $e = (v, u)$ then $G$ is not a **DAG**. Output cycle $C$ formed by path from $u$ to $v$ in $T$ plus edge $(v, u)$.
3. Otherwise output nodes in decreasing post-visit order. **Note:** no need to sort, $\text{DFS}(G)$ can output nodes in this order.

Algorithm runs in $O(n + m)$ time.
Using DFS...

... to check for Acylicity and compute Topological Ordering

**Question**

Given $G$, is it a DAG? If it is, generate a topological sort. Else output a cycle $C$.

**DFS** based algorithm:

1. **Compute** $\text{DFS}(G)$
2. If there is a back edge $e = (v, u)$ then $G$ is not a DAG. Output cycle $C$ formed by path from $u$ to $v$ in $T$ plus edge $(v, u)$.
3. Otherwise output nodes in decreasing post-visit order. **Note**: no need to sort, $\text{DFS}(G)$ can output nodes in this order.

Algorithm runs in $O(n + m)$ time.

Correctness is not so obvious. See next two propositions.
Proposition

$G$ has a cycle iff there is a back-edge in $\text{DFS}(G)$.

Proof.

If: $(u, v)$ is a back edge implies there is a cycle $C$ consisting of the path from $v$ to $u$ in $\text{DFS}$ search tree and the edge $(u, v)$.

Only if: Suppose there is a cycle $C = v_1 \rightarrow v_2 \rightarrow \ldots \rightarrow v_k \rightarrow v_1$. Let $v_i$ be first node in $C$ visited in $\text{DFS}$. All other nodes in $C$ are descendants of $v_i$ since they are reachable from $v_i$. Therefore, $(v_{i-1}, v_i)$ (or $(v_k, v_1)$ if $i = 1$) is a back edge.
Proof

Proposition

If $G$ is a DAG and $\text{post}(v) > \text{post}(u)$, then $(u, v)$ is not in $G$.

Proof.

Assume $\text{post}(v) > \text{post}(u)$ and $(u, v)$ is an edge in $G$. We derive a contradiction. One of two cases holds from DFS property.

- **Case 1:** $[\text{pre}(u), \text{post}(u)]$ is contained in $[\text{pre}(v), \text{post}(v)]$. Implies that $u$ is explored during $\text{DFS}(v)$ and hence is a descendent of $v$. Edge $(u, v)$ implies a cycle in $G$ but $G$ is assumed to be DAG!

- **Case 2:** $[\text{pre}(u), \text{post}(u)]$ is disjoint from $[\text{pre}(v), \text{post}(v)]$. This cannot happen since $v$ would be explored from $u$. 

Example
Part IV

Linear time algorithm for finding all strong connected components of a directed graph
Finding all SCCs of a Directed Graph

Problem
Given a directed graph \( G = (V, E) \), output all its strong connected components.
Finding all SCCs of a Directed Graph

Problem
Given a directed graph $G = (V, E)$, output all its strong connected components.

Straightforward algorithm:

Mark all vertices in $V$ as not visited.

for each vertex $u \in V$ not visited yet do

find $SCC(G, u)$ the strong component of $u$:

Compute $rch(G, u)$ using $DFS(G, u)$

Compute $rch(G^{rev}, u)$ using $DFS(G^{rev}, u)$

$\rightarrow SCC(G, u) \leftarrow rch(G, u) \cap rch(G^{rev}, u)$

$\rightarrow \forall u \in SCC(G, u)$: Mark $u$ as visited.

Running time: $O(n(n + m))$
Finding all SCCs of a Directed Graph

Problem
Given a directed graph \( G = (V, E) \), output all its strong connected components.

Straightforward algorithm:
Mark all vertices in \( V \) as not visited.
for each vertex \( u \in V \) not visited yet do
find \( SCC(G, u) \) the strong component of \( u \):
Compute \( rch(G, u) \) using \( DFS(G, u) \)
Compute \( rch(G^{rev}, u) \) using \( DFS(G^{rev}, u) \)
\( SCC(G, u) \leftarrow rch(G, u) \cap rch(G^{rev}, u) \)
\( \forall u \in SCC(G, u) : \) Mark \( u \) as visited.

Running time: \( O(n(n + m)) \)
Is there an \( O(n + m) \) time algorithm?
Remainder

\( G^{\text{SCC}} \) is created by collapsing every strong connected component to a single vertex.

Proposition

*For a directed graph* \( G \), *its meta-graph* \( G^{\text{SCC}} \) *is a DAG.*
Linear-time Algorithm for SCCs: Ideas

Exploit structure of meta-graph...

Wishful Thinking Algorithm

1. Let \( u \) be a vertex in a sink SCC of \( G^{\text{SCC}} \)
2. Do DFS\((u)\) to compute SCC\((u)\)
3. Remove SCC\((u)\) and repeat

Justification
1. DFS\((u)\) only visits vertices (and edges) in SCC\((u)\)
Linear-time Algorithm for SCCs: Ideas

Exploit structure of meta-graph...

**Wishful Thinking Algorithm**

1. Let \( u \) be a vertex in a sink SCC of \( G^{SCC} \)
2. Do \( \text{DFS}(u) \) to compute \( \text{SCC}(u) \)
3. Remove \( \text{SCC}(u) \) and repeat

**Justification**

1. \( \text{DFS}(u) \) only visits vertices (and edges) in \( \text{SCC}(u) \)
Linear-time Algorithm for SCCs: Ideas
Exploit structure of meta-graph...

**Wishful Thinking Algorithm**

1. Let $u$ be a vertex in a *sink* SCC of $G^{SCC}$
2. Do $\text{DFS}(u)$ to compute $\text{SCC}(u)$
3. Remove $\text{SCC}(u)$ and repeat

**Justification**

1. $\text{DFS}(u)$ only visits vertices (and edges) in $\text{SCC}(u)$
2. ... since there are no edges coming out a sink!
Linear-time Algorithm for SCCs: Ideas

Exploit structure of meta-graph...

Wishful Thinking Algorithm

1. Let $u$ be a vertex in a sink SCC of $G^{SCC}$
2. Do $\text{DFS}(u)$ to compute $\text{SCC}(u)$
3. Remove $\text{SCC}(u)$ and repeat

Justification

1. $\text{DFS}(u)$ only visits vertices (and edges) in $\text{SCC}(u)$
2. ... since there are no edges coming out a sink!
3. $\text{DFS}(u)$ takes time proportional to size of $\text{SCC}(u)$
Linear-time Algorithm for SCCs: Ideas

Exploit structure of meta-graph...

Wishful Thinking Algorithm

1. Let \( u \) be a vertex in a sink SCC of \( G^{\text{SCC}} \)
2. Do \( \text{DFS}(u) \) to compute \( \text{SCC}(u) \)

2. ... since there are no edges coming out a sink!
3. \( \text{DFS}(u) \) takes time proportional to size of \( \text{SCC}(u) \)
4. Therefore, total time \( O(n + m) \)!
How do we find a vertex in a sink \textit{SCC} of \( G^{\text{SCC}} \)?

Answer: \( \text{DFS}(G) \) gives some information!
Big Challenge(s)

How do we find a vertex in a sink $SCC$ of $G^{SCC}$?

Can we obtain an *implicit* topological sort of $G^{SCC}$ without computing $G^{SCC}$?
Big Challenge(s)

How do we find a vertex in a sink SCC of $G^{SCC}$?

Can we obtain an *implicit* topological sort of $G^{SCC}$ without computing $G^{SCC}$?

Answer: $\text{DFS}(G)$ gives some information!
Linear Time Algorithm

...for computing the strong connected components in $G$

```
do DFS($G^{rev}$) and output vertices in decreasing post order.
Mark all nodes as unvisited
for each $u$ in the computed order do
  if $u$ is not visited then
    DFS($u$)
    Let $S_u$ be the nodes reached by $u$
    Output $S_u$ as a strong connected component
  Remove $S_u$ from $G$
```

Theorem

Algorithm runs in time $O(m + n)$ and correctly outputs all the SCCs of $G$. 
Graph $G$:

$G$:

$G_{rev}$:

DFS of reverse graph:

Pre/Post DFS numbering of reverse graph:
Linear Time Algorithm: An Example

Removing connected components: 1

Original graph $G$ with rev post numbers:

Do **DFS** from vertex $G$ remove it.

$\text{SCC computed: } \{ G \}$
Linear Time Algorithm: An Example

Removing connected components: 2

Do **DFS** from vertex \( G \)
remove it.

SCC computed: \( \{ G \} \)

Do **DFS** from vertex \( H \),
remove it.

SCC computed: \( \{ G \}, \{ H \} \)
Linear Time Algorithm: An Example

Removing connected components: 3

Do **DFS** from vertex $H$, remove it.

Do **DFS** from vertex $B$
Remove visited vertices: \{F, B, E\}.

**SCC** computed: \{G\}, \{H\}

**SCC** computed: \{G\}, \{H\}, \{F, B, E\}
Linear Time Algorithm: An Example

Removing connected components: 4

Do **DFS** from vertex *F*
Remove visited vertices: 
\{F, B, E\}.

SCC computed:
\{G\}, \{H\}, \{F, B, E\}

Do **DFS** from vertex *A*
Remove visited vertices:
\{A, C, D\}.

SCC computed:
\{G\}, \{H\}, \{F, B, E\}, \{A, C, D\}
Linear Time Algorithm: An Example

Final result

\[
\text{SCC computed:} \quad \{ G \}, \{ H \}, \{ F, B, E \}, \{ A, C, D \}
\]

Which is the correct answer!
Obtaining the meta-graph...

Once the strong connected components are computed.

Exercise:

Given all the strong connected components of a directed graph $G = (V, E)$ show that the meta-graph $G^{SCC}$ can be obtained in $O(m + n)$ time.
Solving Problems on Directed Graphs

A template for a class of problems on directed graphs:

- Is the problem solvable when $G$ is strongly connected?
- Is the problem solvable when $G$ is a DAG?
- If the above two are feasible then is the problem solvable in a general directed graph $G$ by considering the meta graph $G^{SCC}$?
Part V

An Application to make
(A) I know what make/makefile is.
(B) I do NOT know what make/makefile is.
Unix utility for automatically building large software applications

A makefile specifies

1. Object files to be created,
2. Source/object files to be used in creation, and
3. How to create them
An Example makefile

project: main.o utils.o command.o
    cc -o project main.o utils.o command.o

main.o: main.c defs.h
    cc -c main.c
utils.o: utils.c defs.h command.h
    cc -c utils.c
command.o: command.c defs.h command.h
    cc -c command.c
makefile as a Digraph

main.c → main.o

utils.c

defs.h → utils.o → project

command.h → command.o

command.c
Computational Problems for `make`

1. Is the `makefile` reasonable?
2. If it is reasonable, in what order should the object files be created?
3. If it is not reasonable, provide helpful debugging information.
4. If some file is modified, find the fewest compilations needed to make application consistent.
Algorithms for make

1. Is the makefile reasonable? Is $G$ a DAG?

2. If it is reasonable, in what order should the object files be created? Find a topological sort of a DAG.

3. If it is not reasonable, provide helpful debugging information. Output a cycle. More generally, output all strong connected components.

4. If some file is modified, find the fewest compilations needed to make application consistent.

   1. Find all vertices reachable (using DFS/BFS) from modified files in directed graph, and recompile them in proper order. Verify that one can find the files to recompile and the ordering in linear time.
Take away Points

1. Given a directed graph $G$, its SCCs and the associated acyclic meta-graph $G^{SCC}$ give a structural decomposition of $G$ that should be kept in mind.

2. There is a DFS based linear time algorithm to compute all the SCCs and the meta-graph. Properties of DFS crucial for the algorithm.

3. DAGs arise in many application and topological sort is a key property in algorithm design. Linear time algorithms to compute a topological sort (there can be many possible orderings so not unique).
