Recall fooling sets and distinguishability. Two strings $x, y \in \Sigma^*$ are suffix distinguishable with respect to a given language $L$ if there is a string $z$ such that exactly one of $xz$ and $yz$ is in $L$. This means that any DFA that accepts $L$ must necessarily take $x$ and $y$ to different states from its start state. A set of strings $F$ is a fooling set for $L$ if any pair of strings $x, y \in F, x \neq y$ are distinguishable. This means that any DFA for $L$ requires at least $|F|$ states. To prove non-regularity of a language $L$ you need to find an infinite fooling set $F$ for $L$. Given a language $L$ try to find a constant size fooling set first and then prove that one of size $n$ exists for any given $n$ which is basically the same as finding an infinite fooling set.

Note that another method to prove non-regularity is via reductions. Suppose you want to prove that $L$ is non-regular. You can do regularity preserving operations on $L$ to obtain a language $L'$ which you already know is non-regular. Then $L$ must not have been regular. For instance if $\bar{L}$ is not regular then $L$ is also not regular. You will see an example in Problem 4 below.

Prove that each of the following languages is not regular.

1. $\{0^{2n}1^n \mid n \geq 0\}$

2. $\{0^m1^n \mid m \neq 2n\}$

3. $\{0^{2n} \mid n \geq 0\}$

4. Strings over $\{0, 1\}$ where the number of $0$s is exactly twice the number of $1$s.
   - Describe an infinite fooling set for the language.
   - Use closure properties. What is language if you intersect the given language with $0^*1^*$?

5. Strings of properly nested parentheses $( )$, brackets $[ ]$, and braces $\{ \}$.
   - Describe an infinite fooling set for the language.
   - Use closure properties.

6. Strings of the form $w_1\#w_2\#\cdots\#w_n$ for some $n \geq 2$, where each substring $w_i$ is a string in $\{0, 1\}^*$, and some pair of substrings $w_i$ and $w_j$ are equal.

Work on these later:

7. $\{0^{n^2} \mid n \geq 0\}$

8. $\{w \in (0 + 1)^* \mid w$ is the binary representation of a perfect square}
