Recall fooling sets and distinguishability. Two strings  $x, y \in \Sigma^*$  are suffix distinguishable with respect to a given language L if there is a string z such that exactly one of xz and yz is in L. This means that any DFA that accepts L must necessarily take x and y to different states from its start state. A set of strings F is a fooling set for L if any pair of strings  $x, y \in F, x \neq y$  are distinguisable. This means that any DFA for L requires at least |F| states. To prove non-regularity of a language L you need to find an infinite fooling set F for L. Given a language L try to find a constant size fooling set first and then prove that one of size R exists for any given R which is basically the same as finding an infinite fooling set.

Note that another method to prove non-regularity is via *reductions*. Suppose you want to prove that L is non-regular. You can do regularity preserving operations on L to obtain a language L' which you already know is non-regular. Then L must not have been regular. For instance if  $\bar{L}$  is not regular then L is also not regular. You will see an example in Problem 4 below.

Prove that each of the following languages is *not* regular.

- 1.  $\{\mathbf{0}^{2n}\mathbf{1}^n \mid n \geq 0\}$
- 2.  $\{\mathbf{0}^m \mathbf{1}^n \mid m \neq 2n\}$
- 3.  $\{\mathbf{0}^{2^n} \mid n \ge 0\}$
- 4. Strings over  $\{0, 1\}$  where the number of 0s is exactly twice the number of 1s.
  - Describe an infinite fooling set for the language.
  - Use closure properties. What is language if you intersect the given language with 0\*1\*?
- 5. Strings of properly nested parentheses (), brackets [], and braces {}. For example, the string ([]) {} is in this language, but the string ([)] is not, because the left and right delimiters don't match.
  - Describe an infinite fooling set for the language.
  - Use closure properties.
- 6. Strings of the form  $w_1 \# w_2 \# \cdots \# w_n$  for some  $n \ge 2$ , where each substring  $w_i$  is a string in  $\{0,1\}^*$ , and some pair of substrings  $w_i$  and  $w_j$  are equal.

## Work on these later:

- 7.  $\{\mathbf{0}^{n^2} \mid n \ge 0\}$
- 8.  $\{w \in (0+1)^* \mid w \text{ is the binary representation of a perfect square}\}$
