## CS/ECE 374: Algorithms \& Models of Computation

# More DP: Edit Distance and Independent Sets in Trees 

Lecture 14
March 7, 2023

## Exercise: how many subproblems?

Consider computing $f(x, y)$ by recursive function + memoization.

$$
\begin{array}{r}
f(x, y)=\sum_{i=1}^{x+y-1} x * f(x+y-i, i-1) \\
f(0, y)=y \quad f(x, 0)=x
\end{array}
$$

How many distinct subproblems when computing $\boldsymbol{f}(\boldsymbol{n}, \boldsymbol{n})$ ?

- $O(n)$
- $O(n \log n)$
- $O\left(n^{2}\right)$
- $O\left(n^{3}\right)$
- The function is ill defined - it can not be computed.

## What is the running time for each subproblem?

Consider computing $f(x, y)$ by recursive function + memoization.

$$
\begin{array}{r}
f(x, y)=\sum_{i=1}^{x+y-1} x * f(x+y-i, i-1) \\
f(0, y)=y \quad f(x, 0)=x
\end{array}
$$

The worst-case time to evaluate the output of a subproblem given values for its recursive subproblems when computing $f(n, n)$ is:

- $O(n)$
- $O(\boldsymbol{n} \log n)$
- $O\left(n^{2}\right)$
- $O\left(n^{3}\right)$
- The function is ill defined - it can not be computed.

## What is the total running time?

Consider computing $f(x, y)$ by recursive function + memoization.

$$
\begin{array}{r}
f(x, y)=\sum_{i=1}^{x+y-1} x * f(x+y-i, i-1) \\
f(0, y)=y \quad f(x, 0)=x
\end{array}
$$

The resulting algorithm when computing $\boldsymbol{f}(\boldsymbol{n}, \boldsymbol{n})$ would take:

- $O(n)$
- $O(n \log n)$
- $O\left(n^{2}\right)$
- $O\left(n^{3}\right)$
- The function is ill defined - it can not be computed.

## Recipe for Dynamic Programming

(1) Develop a recursive backtracking style algorithm $\mathcal{A}$ for given problem.
(2) Identify structure of subproblems generated by $\mathcal{A}$ on an instance I of size $\boldsymbol{n}$
(1) Estimate number of different subproblems generated as a function of $\boldsymbol{n}$. Is it polynomial or exponential in $\boldsymbol{n}$ ?
(2) If the number of problems is "small" (polynomial) then they typically have some "clean" structure.
(3) Rewrite subproblems in a compact fashion.
(4) Rewrite recursive algorithm in terms of notation for subproblems.
(5) Convert to iterative algorithm by bottom up evaluation in an appropriate order.
(c) Optimize further with data structures and/or additional ideas.

## A variation

Input A string $w \in \Sigma^{*}$ and access to a language $L \subseteq \Sigma^{*}$ via function IsStringinL(string $x$ ) that decides whether $x$ is in $L$, and non-negative integer $k$
Goal Decide if $w \in L^{k}$ using IsStringinL(string $\left.x\right)$ as a black box sub-routine

## Example

Suppose $L$ is English and we have a procedure to check whether a string/word is in the English dictionary.

- Is the string "isthisanenglishsentence" in English ${ }^{5}$ ?
- Is the string "isthisanenglishsentence" in English ${ }^{4}$ ?
- Is "asinineat" in English ${ }^{2}$ ?
- Is "asinineat" in English ${ }^{4}$ ?
- Is "zibzzzad" in English"?

## Recursive Solution

When is $w \in L^{k}$ ?

## Recursive Solution

When is $w \in L^{k}$ ?
$k=0: w \in L^{k}$ iff $w=\epsilon$
$k=1: w \in L^{k}$ iff $w \in L$
$\boldsymbol{k}>1: \boldsymbol{w} \in L^{k}$ if $\boldsymbol{w}=\boldsymbol{u} \boldsymbol{v}$ with $\boldsymbol{u} \in L$ and $\boldsymbol{v} \in L^{k-1}$

## Recursive Solution

When is $w \in L^{k}$ ?
$k=0: w \in L^{k}$ iff $w=\epsilon$
$k=1: w \in L^{k}$ iff $w \in L$
$\boldsymbol{k}>1: \boldsymbol{w} \in L^{k}$ if $\boldsymbol{w}=\boldsymbol{u} \boldsymbol{v}$ with $\boldsymbol{u} \in L$ and $\boldsymbol{v} \in L^{k-1}$
Assume $w$ is stored in array $\boldsymbol{A}[1 . . n]$
IsStringinLk(A[1..n], $\boldsymbol{k})$ :

```
If ( \(k=0\) )
        If ( \(\boldsymbol{n}=0\) ) Output YES
        Else Ouput NO
    If ( \(\boldsymbol{k}=1\) )
    Output IsStringinL( \(\boldsymbol{A}[1 . . n])\)
    Else
        For ( \(\boldsymbol{i}=1\) to \(\boldsymbol{n}-1\) ) do
        If (IsStringinL(A[1..i]) and IsStringinLk(A[i+1..n],k-1))
        Output YES
```

## Analysis

IsStringinLk(A[1..n], $\boldsymbol{k})$ :

```
If ( \(\boldsymbol{k}=0\) )
        If ( \(\boldsymbol{n}=0\) ) Output YES
        Else Ouput NO
```

    If ( \(\boldsymbol{k}=1\) )
        Output IsStringinL(A[1..n])
    Else
        For ( \(\boldsymbol{i}=1\) to \(\boldsymbol{n}-1\) ) do
        If (IsStringinL(A[1..i]) and IsStringinLk(A[i+1..n],k-1))
        Output YES
    Output NO
    - How many distinct sub-problems are generated by IsStringinLk $(A[1 . . n], k)$ ?

## Analysis

IsStringinLk(A[1..n], $\boldsymbol{k})$ :

```
If ( \(\boldsymbol{k}=0\) )
        If ( \(\boldsymbol{n}=0\) ) Output YES
        Else Ouput NO
    If ( \(\boldsymbol{k}=1\) )
        Output IsStringinL( \(\boldsymbol{A}[1 . . n])\)
```

    Else
        For ( \(\boldsymbol{i}=1\) to \(\boldsymbol{n}-1\) ) do
        If (IsStringinL(A[1..i]) and IsStringinLk(A[i+1..n],k-1))
        Output YES
    Output NO
    - How many distinct sub-problems are generated by IsStringinLk $(A[1 . . n], k)$ ? $O(n k)$

## Analysis

IsStringinLk(A[1..n], $\boldsymbol{k})$ :

```
If \((\boldsymbol{k}=0)\)
        If \((\boldsymbol{n}=0)\) Output YES
        Else Ouput NO
    If \((\boldsymbol{k}=1)\)
        Output IsStringinL( \(\boldsymbol{A}[1 . . n])\)
    Else
        For ( \(\boldsymbol{i}=1\) to \(\boldsymbol{n}-1\) ) do
        If (IsStringinL( \(\boldsymbol{A}[1 . . \boldsymbol{i}])\) and IsStringinLk \((\boldsymbol{A}[\boldsymbol{i}+1 . . \boldsymbol{n}], \boldsymbol{k}-1)\) )
        Output YES
```

    Output NO
    - How many distinct sub-problems are generated by IsStringinLk $(A[1 . . n], k)$ ? $O(n k)$
- How much space?

## Analysis

IsStringinLk(A[1..n], $\boldsymbol{k})$ :

```
If \((\boldsymbol{k}=0)\)
        If \((\boldsymbol{n}=0)\) Output YES
        Else Ouput NO
    If \((\boldsymbol{k}=1)\)
        Output IsStringinL( \(\boldsymbol{A}[1 . . n])\)
    Else
        For ( \(\boldsymbol{i}=1\) to \(\boldsymbol{n}-1\) ) do
        If (IsStringinL( \(\boldsymbol{A}[1 . . \boldsymbol{i}])\) and IsStringinLk \((\boldsymbol{A}[\boldsymbol{i}+1 . . \boldsymbol{n}], \boldsymbol{k}-1)\) )
        Output YES
```

    Output NO
    - How many distinct sub-problems are generated by IsStringinLk $(A[1 . . n], k)$ ? $O(n k)$
- How much space? $O(n k)$

## Analysis

IsStringinLk(A[1..n], $\boldsymbol{k})$ :

```
If \((\boldsymbol{k}=0)\)
        If \((\boldsymbol{n}=0)\) Output YES
        Else Ouput NO
    If \((\boldsymbol{k}=1)\)
        Output IsStringinL( \(\boldsymbol{A}[1 . . n])\)
    Else
        For ( \(\boldsymbol{i}=1\) to \(\boldsymbol{n}-1\) ) do
        If (IsStringinL( \(A[1 . . i])\) and IsStringinLk \((A[i+1 . . n], k-1)\) )
        Output YES
```

    Output NO
    - How many distinct sub-problems are generated by IsStringinLk $(A[1 . . n], k)$ ? $O(n k)$
- How much space? $O(n k)$
- Running time?

## Analysis

IsStringinLk(A[1..n], $\boldsymbol{k})$ :

```
If \((\boldsymbol{k}=0)\)
        If \((\boldsymbol{n}=0)\) Output YES
        Else Ouput NO
    If \((\boldsymbol{k}=1)\)
        Output IsStringinL( \(\boldsymbol{A}[1 . . n])\)
    Else
        For ( \(\boldsymbol{i}=1\) to \(\boldsymbol{n}-1\) ) do
        If (IsStringinL( \(\boldsymbol{A}[1 . . \boldsymbol{i}])\) and IsStringinLk \((\boldsymbol{A}[\boldsymbol{i}+1 . . \boldsymbol{n}], \boldsymbol{k}-1)\) )
        Output YES
```

    Output NO
    - How many distinct sub-problems are generated by IsStringinLk $(A[1 . . n], k)$ ? $O(n k)$
- How much space? $O(n k)$
- Running time? $O\left(n^{2} k\right)$

## Naming subproblems and recursive equation

$\operatorname{ISLk}(i, h)$ : a boolean which is 1 if $A[i . . n]$ is in $L^{h}, 0$ otherwise Base case: $\operatorname{ISLk}(\boldsymbol{n}+1,0)=1$ interpreting $\boldsymbol{A}[\boldsymbol{n}+1 . . \boldsymbol{n}]$ as $\boldsymbol{\epsilon}$

## Naming subproblems and recursive equation

$\operatorname{ISLk}(i, h)$ : a boolean which is 1 if $A[i . . n]$ is in $L^{h}, 0$ otherwise
Base case: $\operatorname{ISLk}(\boldsymbol{n}+1,0)=1$ interpreting $\boldsymbol{A}[\boldsymbol{n}+1 . . \boldsymbol{n}]$ as $\boldsymbol{\epsilon}$
Recursive relation:

- $\operatorname{ISLk}(\boldsymbol{i}, \boldsymbol{h})=1$ if $\exists \boldsymbol{i}<\boldsymbol{j} \leq \boldsymbol{n}+1$ such that $(\operatorname{ISLk}(j, \boldsymbol{h}-1)=1$ and $\operatorname{IsStringinL}(\boldsymbol{A}[i . .(j-1])=1)$
- $\operatorname{ISLk}(i, h)=0$ otherwise

Output: $\operatorname{ISLk}(1, \boldsymbol{k})$

## Iterative Algorithm

```
IsStringinLk(A[1..n], k):
    Boolean ISLk[1..(n+1)][0..k]
    ISLk[\boldsymbol{n}+1][0] = TRUE
    For (i=1 to n) do
        ISLk[i][0] = FALSE
```

    For ( \(\boldsymbol{i}=1\) to \(\boldsymbol{n}\) ) do
        For ( \(\boldsymbol{h}=1\) to \(\boldsymbol{k}\) ) do
        \(\operatorname{ISLk}[i][\boldsymbol{h}]=\) FALSE
        For ( \(\boldsymbol{j}=\boldsymbol{i}+1\) to \(\boldsymbol{n}+1\) ) do
        If (ISLk[j][h-1] and IsStringinL( \(\boldsymbol{A}[\mathbf{i} . .(j-1)])\) ) then
        \(\operatorname{ISLk}[\boldsymbol{i}][\boldsymbol{h}]=\) TRUE
    Output ISLk[1][k]
    
## Another variant

Question: What if we want to check if $w \in L^{i}$ for some $0 \leq i \leq k$ ? That is, is $w \in \cup_{i=0}^{k} L^{i}$ ?

## Exercise

## Definition

A string is a palindrome if $w=w^{R}$. Examples: I, RACECAR, MALAYALAM, DOOFFOOD

## Exercise

## Definition

A string is a palindrome if $w=w^{R}$.
Examples: I, RACECAR, MALAYALAM, DOOFFOOD

Problem: Given a string $w$ find the longest subsequence of $w$ that is a palindrome.

## Example

MAHDYNAMICPROGRAMZLETMESHOWYOUTHEM has MHYMRORMYHM as a palindromic subsequence

## Exercise

Assume $\boldsymbol{w}$ is stored in an array $\boldsymbol{A}[1 . . n]$
$\operatorname{LPS}(i, j)$ : length of longest palindromic subsequence of $A[i . . j]$.
Recursive expression/code?

## Part I

## Edit Distance and Sequence Alignment

## Spell Checking Problem

Given a string "exponen" that is not in the dictionary, how should a spell checker suggest a nearby string?

## Spell Checking Problem

Given a string "exponen" that is not in the dictionary, how should a spell checker suggest a nearby string?

What does nearness mean?

Question: Given two strings $x_{1} x_{2} \ldots x_{\boldsymbol{n}}$ and $y_{1} y_{2} \ldots y_{\boldsymbol{m}}$ what is a distance between them?

## Spell Checking Problem

Given a string "exponen" that is not in the dictionary, how should a spell checker suggest a nearby string?

What does nearness mean?

Question: Given two strings $x_{1} x_{2} \ldots x_{\boldsymbol{n}}$ and $y_{1} y_{2} \ldots y_{\boldsymbol{m}}$ what is a distance between them?

Edit Distance: minimum number of "edits" to transform $\boldsymbol{x}$ into $\boldsymbol{y}$.

## Edit Distance

## Definition

Edit distance between two words $\boldsymbol{X}$ and $\boldsymbol{Y}$ is the number of letter insertions, letter deletions and letter substitutions required to obtain $Y$ from $X$.

## Example

The edit distance between FOOD and MONEY is at most 4:

$$
\underline{\text { FOOD }} \rightarrow \text { MOOD } \rightarrow \text { MONOD } \rightarrow \text { MONED } \rightarrow \text { MONEY }
$$

## Edit Distance: Alternate View

## Alignment

Place words one on top of the other, with gaps in the first word indicating insertions, and gaps in the second word indicating deletions.

| F | $\mathbf{O}$ | $\mathbf{O}$ |  | $\mathbf{D}$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathbf{M}$ | $\mathbf{O}$ | $\mathbf{N}$ | $\mathbf{E}$ | $\mathbf{Y}$ |

## Edit Distance: Alternate View

## Alignment

Place words one on top of the other, with gaps in the first word indicating insertions, and gaps in the second word indicating deletions.

| $\mathbf{F}$ | $\mathbf{O}$ | $\mathbf{O}$ |  | $\mathbf{D}$ |
| :---: | :---: | :---: | :---: | :---: |
| $\mathbf{M}$ | $\mathbf{O}$ | $\mathbf{N}$ | $\mathbf{E}$ | $\mathbf{Y}$ |

Formally, an alignment is a set $M$ of pairs $(i, j)$ such that each index appears at most once, and there is no "crossing": $\boldsymbol{i}<\boldsymbol{i}$ ' and $\boldsymbol{i}$ is matched to $\boldsymbol{j}$ implies $i^{\prime}$ is matched to $\boldsymbol{j}^{\prime}>\boldsymbol{j}$. In the above example, this is $M=\{(1,1),(2,2),(3,3),(4,5)\}$.

## Edit Distance: Alternate View

## Alignment

Place words one on top of the other, with gaps in the first word indicating insertions, and gaps in the second word indicating deletions.

| $\mathbf{F}$ | $\mathbf{O}$ | $\mathbf{O}$ |  | $\mathbf{D}$ |
| :---: | :---: | :---: | :---: | :---: |
| $\mathbf{M}$ | $\mathbf{O}$ | $\mathbf{N}$ | $\mathbf{E}$ | $\mathbf{Y}$ |

Formally, an alignment is a set $M$ of pairs $(i, j)$ such that each index appears at most once, and there is no "crossing": $\boldsymbol{i}<\boldsymbol{i}$ ' and $\boldsymbol{i}$ is matched to $\boldsymbol{j}$ implies $\boldsymbol{i}^{\prime}$ is matched to $\boldsymbol{j}^{\prime}>\boldsymbol{j}$. In the above example, this is $M=\{(1,1),(2,2),(3,3),(4,5)\}$. Cost of an alignment is the number of mismatched columns plus number of unmatched indices in both strings.

## Edit Distance Problem

## Problem

Given two words, find the edit distance between them, i.e., an alignment of smallest cost.

## Applications

(1) Spell-checkers and Dictionaries
(2) Unix diff
(3) DNA sequence alignment . . . but, we need a new metric

## Similarity Metric

## Definition

For two strings $X$ and $Y$, the cost of alignment $M$ is
(1) [Gap penalty] For each gap in the alignment, we incur a cost $\boldsymbol{\delta}$.
(2) [Mismatch cost] For each pair $\boldsymbol{p}$ and $\boldsymbol{q}$ that have been matched in $M$, we incur cost $\boldsymbol{\alpha}_{\boldsymbol{p} \boldsymbol{q}}$; typically $\boldsymbol{\alpha}_{\boldsymbol{p} \boldsymbol{p}}=0$.

## Similarity Metric

## Definition

For two strings $X$ and $Y$, the cost of alignment $M$ is
(1) [Gap penalty] For each gap in the alignment, we incur a cost $\boldsymbol{\delta}$.
(2) Mismatch cost] For each pair $\boldsymbol{p}$ and $\boldsymbol{q}$ that have been matched in $M$, we incur cost $\boldsymbol{\alpha}_{\boldsymbol{p} \boldsymbol{q}}$; typically $\boldsymbol{\alpha}_{\boldsymbol{p} \boldsymbol{p}}=0$.
Edit distance is special case when $\boldsymbol{\delta}=\boldsymbol{\alpha}_{\boldsymbol{p} \boldsymbol{q}}=1$.

## An Example

## Example

$$
\begin{array}{l|l|l|l|l|l|l|l|l|l|l}
o & & c & u & r & r & a & n & c & e \\
o & c & c & u & r & r & e & n & c & e
\end{array} \quad \operatorname{Cost}=\boldsymbol{\delta}+\boldsymbol{\alpha}_{a \boldsymbol{e}}
$$

Alternative:

$$
\begin{array}{l|l|l|l|l|l|l|l|l|l|l}
o & & c & u & r & r & & a & n & c & e \\
o & c & c & u & r & r & e & & n & c & e
\end{array} \quad \text { Cost }=3 \delta
$$

Or a really stupid solution (delete string, insert other string):

Cost $=19 \delta$.

## What is the edit distance between...

## Sequence Alignment

Input Given two words $X$ and $Y$, and gap penalty $\delta$ and
mismatch costs $\alpha_{p q}$
Goal Find alignment of minimum cost

## Edit distance

Let $X=\alpha x$ and $Y=\beta y$
$\alpha, \beta$ : strings.
$x$ and $y$ single characters.
Think about optimal edit distance between $X$ and $Y$ as alignment, and consider last column of alignment of the two strings:

| $\alpha$ | $x$ |
| :---: | :---: |
| $\boldsymbol{\beta}$ | $y$ |

or

| $\alpha$ | $x$ |
| :---: | :---: |
| $\beta y$ |  |

| $\alpha x$ |  |
| :---: | :---: |
| $\beta$ | $y$ |

## Observation

Prefixes must have optimal alignment!

## Problem Structure

## Observation

Let $\boldsymbol{X}=x_{1} x_{2} \cdots x_{\boldsymbol{m}}$ and $Y=y_{1} y_{2} \cdots y_{\boldsymbol{n}}$. If $(\boldsymbol{m}, \boldsymbol{n})$ are not matched then either the $\boldsymbol{m} t h$ position of $\boldsymbol{X}$ remains unmatched or the $n$th position of $Y$ remains unmatched.
(1) Case $x_{m}$ and $y_{n}$ are matched.
(1) Pay mismatch cost $\alpha_{x_{m} y_{n}}$ plus cost of aligning strings

$$
\boldsymbol{x}_{1} \cdots \boldsymbol{x}_{\boldsymbol{m}-1} \text { and } \boldsymbol{y}_{1} \cdots \boldsymbol{y}_{\boldsymbol{n}-1}
$$

(2) Case $x_{m}$ is unmatched.
(1) Pay gap penalty plus cost of aligning $\boldsymbol{x}_{1} \cdots \boldsymbol{x}_{\boldsymbol{m}-1}$ and $\boldsymbol{y}_{1} \cdots \boldsymbol{y}_{\boldsymbol{n}}$
(3) Case $y_{n}$ is unmatched.
(1) Pay gap penalty plus cost of aligning $\boldsymbol{x}_{1} \cdots \boldsymbol{x}_{\boldsymbol{m}}$ and $\boldsymbol{y}_{1} \cdots \boldsymbol{y}_{\boldsymbol{n}-1}$

## Recursive Algorithm

Assume $X$ is stored in array $A[1 . . m]$ and $Y$ is stored in $B[1 . . n]$ Array COST stores cost of matching two chars. Thus $\operatorname{COST}[a, b]$ give the cost of matching character $\boldsymbol{a}$ to character $\boldsymbol{b}$.

```
EditDist(A[1..m], B[1..n])
    If ( \(\boldsymbol{m}=0\) ) return \(\boldsymbol{n} \boldsymbol{\delta}\)
    If ( \(\boldsymbol{n}=0\) ) return \(\boldsymbol{m} \boldsymbol{\delta}\)
    \(\boldsymbol{m}_{1}=\boldsymbol{\delta}+\operatorname{EditDist}(\boldsymbol{A}[1 . .(\boldsymbol{m}-1)], \boldsymbol{B}[1 . . \boldsymbol{n}])\)
    \(\left.\boldsymbol{m}_{2}=\boldsymbol{\delta}+\operatorname{EditDist}(\boldsymbol{A}[1 . . \boldsymbol{m}], \boldsymbol{B}[1 . .(\boldsymbol{n}-1)])\right)\)
    \(\boldsymbol{m}_{3}=\operatorname{COST}[\boldsymbol{A}[\boldsymbol{m}], \boldsymbol{B}[\boldsymbol{n}]]+\operatorname{EditDist}(\boldsymbol{A}[1 . .(\boldsymbol{m}-1)], B[1 . .(\boldsymbol{n}-1)])\)
    return \(\min \left(\boldsymbol{m}_{1}, \boldsymbol{m}_{\mathbf{2}}, \boldsymbol{m}_{3}\right)\)
```

## Subproblems and Recurrence

## Optimal Costs

Let OptDist $(i, j)$ be optimal cost of aligning $x_{1} \cdots x_{i}$ and $y_{1} \cdots y_{j}$. Then

$$
\operatorname{OptDist}(i, j)=\min \left\{\begin{array}{l}
\alpha_{x_{x_{i}} y_{j}}+\operatorname{OptDist}(i-1, j-1) \\
\delta+\operatorname{OptDist}(i-1, j), \\
\delta+\operatorname{OptDist}(i, j-1)
\end{array}\right.
$$

## Subproblems and Recurrence

## Optimal Costs

Let OptDist $(i, j)$ be optimal cost of aligning $x_{1} \cdots x_{i}$ and $y_{1} \cdots y_{j}$. Then

$$
\operatorname{OptDist}(i, j)=\min \left\{\begin{array}{l}
\alpha_{x_{i} y_{j}}+\operatorname{OptDist}(i-1, j-1) \\
\delta+\operatorname{OptDist}(i-1, j), \\
\delta+\operatorname{OptDist}(i, j-1)
\end{array}\right.
$$

Base Cases: OptDist $(i, 0)=\boldsymbol{\delta} \cdot \boldsymbol{i}$ and $\operatorname{OptDist}(0, j)=\boldsymbol{\delta} \cdot \boldsymbol{j}$

## Example

## DEED and DREAD

## Memoizing the Recursive Algorithm

```
int M[0..m][0..n]
Initialize all entries of M[i][j] to \infty
return EditDist(A[1..m], B[1..n])
```

$\operatorname{EditDist}(\boldsymbol{A}[1 . . \boldsymbol{m}], \boldsymbol{B}[1 . . \boldsymbol{n}])$

```
If \((M[i][j]<\infty)\) return \(M[i][j]\) (* return stored value *)
If \((\boldsymbol{m}=0)\)
\[
M[i][j]=\boldsymbol{n} \boldsymbol{\delta}
\]
\[
\text { ElseIf }(\boldsymbol{n}=0)
\]
\[
M[i][j]=\boldsymbol{m} \delta
\]
```

Else

$$
\begin{aligned}
& \boldsymbol{m}_{1}=\boldsymbol{\delta}+\operatorname{EditDist}(\boldsymbol{A}[1 . .(\boldsymbol{m}-1)], \boldsymbol{B}[1 . . \boldsymbol{n}]) \\
& \boldsymbol{m}_{2}=\boldsymbol{\delta}+\operatorname{EditDist}(\boldsymbol{A}[1 \ldots \boldsymbol{m}], \boldsymbol{B}[1 . .(\boldsymbol{n}-1)])) \\
& \boldsymbol{m}_{3}=\boldsymbol{C O S T}[\boldsymbol{A}[\boldsymbol{m}], \boldsymbol{B}[\boldsymbol{n}]]+\operatorname{EditDist}(\boldsymbol{A}[1 . .(\boldsymbol{m}-1)], \boldsymbol{B}[1 . .(\boldsymbol{n}-1)]) \\
& \boldsymbol{M}[\boldsymbol{i}][j]=\min \left(\boldsymbol{m}_{1}, \boldsymbol{m}_{2}, \boldsymbol{m}_{3}\right) \\
& \text { return } \boldsymbol{M}[\boldsymbol{i}][\boldsymbol{j}]
\end{aligned}
$$

## Iterative Algorithm

$$
\begin{aligned}
& \text { EditDist }(\boldsymbol{A}[1 . . \boldsymbol{m}], \boldsymbol{B}[1 . . \boldsymbol{n}]) \\
& \text { int } \boldsymbol{M}[0 . . \boldsymbol{m}][0 . . \boldsymbol{n}] \\
& \text { for } \boldsymbol{i}=1 \text { to } \boldsymbol{m} \text { do } \boldsymbol{M}[\boldsymbol{i}, 0]=\boldsymbol{i} \boldsymbol{\delta} \\

& \qquad \boldsymbol{M}[\boldsymbol{i}][\boldsymbol{j}]=\min \left\{\begin{array}{l}
\alpha_{x_{x_{i}} y_{j}}+\boldsymbol{M}[\boldsymbol{i}-1][\boldsymbol{j}-1], \\
\boldsymbol{\delta}+\boldsymbol{M}[\boldsymbol{i}-1][\boldsymbol{j}] \\
\boldsymbol{\delta}+\boldsymbol{M}[\boldsymbol{i}][\boldsymbol{j}-1]
\end{array}\right.
\end{aligned}
$$

## Analysis

## Iterative Algorithm

$$
\begin{aligned}
& \text { EditDist }(\boldsymbol{A}[1 . . \boldsymbol{m}], \boldsymbol{B}[1 . . \boldsymbol{n}]) \\
& \quad \text { int } \boldsymbol{M}[0 . . \boldsymbol{m}][0 . . \boldsymbol{n}] \\
& \text { for } \boldsymbol{i}=1 \text { to } \boldsymbol{m} \text { do } \boldsymbol{M}[\boldsymbol{i}, 0]=\boldsymbol{i} \boldsymbol{\delta} \\
& \text { for } \boldsymbol{j}=1 \text { to } \boldsymbol{n} \text { do } \boldsymbol{M}[0, \boldsymbol{j}]=\boldsymbol{j} \boldsymbol{\delta}
\end{aligned} \quad \begin{aligned}
& \text { for } \boldsymbol{i}=1 \text { to } \boldsymbol{m} \text { do } \\
& \quad \text { for } \boldsymbol{j}=1 \text { to } \boldsymbol{n} \text { do } \\
& \qquad \boldsymbol{M}[\boldsymbol{i}][\boldsymbol{j}]=\min \left\{\begin{array}{l}
\alpha_{x_{x_{i}} y_{j}}+\boldsymbol{M}[\boldsymbol{i}-1][\boldsymbol{j}-1], \\
\boldsymbol{\delta}+\boldsymbol{M}[\boldsymbol{i}-1][\boldsymbol{j}] \\
\boldsymbol{\delta}+\boldsymbol{M}[\boldsymbol{i}][\boldsymbol{j}-1]
\end{array}\right.
\end{aligned}
$$

## Analysis

(1) Running time is $O(m n)$.
(2) Space used is $\mathrm{O}(\mathrm{mn})$.

## Matrix and DAG of Computation

Figure: Iterative algorithm in previous slide computes values in row order.

## Example

## DEED and DREAD

## Sequence Alignment in Practice

(1) Typically the DNA sequences that are aligned are about $10^{5}$ letters long!
(2) So about $10^{10}$ operations and $10^{10}$ bytes needed
(3) The killer is the 10 GB storage

- Can we reduce space requirements?

## Optimizing Space

(1) Recall

$$
M(i, j)=\min \left\{\begin{array}{l}
\alpha_{x_{i} y_{j}}+M(i-1, j-1) \\
\delta+M(i-1, j) \\
\delta+M(i, j-1)
\end{array}\right.
$$

(2) Entries in $j$ th column only depend on $(j-1)$ st column and earlier entries in $j$ th column
(3) Only store the current column and the previous column reusing space; $N(\boldsymbol{i}, 0)$ stores $M(\boldsymbol{i}, \boldsymbol{j}-1)$ and $N(\boldsymbol{i}, 1)$ stores $M(\boldsymbol{i}, \boldsymbol{j})$

## Computing in column order to save space

Figure: $\boldsymbol{M}(\boldsymbol{i}, \boldsymbol{j})$ only depends on previous column values. Keep only two columns and compute in column order.

## Space Efficient Algorithm

$$
\begin{aligned}
& \text { for all } \boldsymbol{i} \text { do } \boldsymbol{N}[\boldsymbol{i}, 0]=\boldsymbol{i} \boldsymbol{\delta} \\
& \text { for } \boldsymbol{j}=1 \text { to } \boldsymbol{n} \text { do } \\
& \boldsymbol{N}[0,1]=\boldsymbol{j} \boldsymbol{\delta} \text { (* corresponds to } \boldsymbol{M}(0, \boldsymbol{j}) *) \\
& \text { for } \boldsymbol{i}=1 \text { to } \boldsymbol{m} \text { do } \\
& \qquad \begin{array}{l}
\boldsymbol{N}[\boldsymbol{i}, 1]=\min \left\{\begin{array}{l}
\alpha_{x_{i^{\prime}} y_{j}}+\boldsymbol{N}[\boldsymbol{i}-1,0] \\
\boldsymbol{\delta}+\boldsymbol{N}[\boldsymbol{i}-1,1] \\
\boldsymbol{\delta}+\boldsymbol{N}[\boldsymbol{i}, 0]
\end{array}\right. \\
\text { for } \boldsymbol{i}=1 \text { to } \boldsymbol{m} \text { do } \\
\text { Copy } \boldsymbol{N}[\boldsymbol{i}, 0]=\boldsymbol{N}[\boldsymbol{i}, 1]
\end{array}
\end{aligned}
$$

## Analysis

Running time is $O(m n)$ and space used is $O(2 m)=O(m)$

## Analyzing Space Efficiency

(1) From the $\boldsymbol{m} \times \boldsymbol{n}$ matrix $M$ we can construct the actual alignment (exercise)
(2) Matrix $N$ computes cost of optimal alignment but no way to construct the actual alignment
(3) Space efficient computation of alignment? More complicated algorithm - see notes and Kleinberg-Tardos book.

## Part II

## Longest Common Subsequence Problem

## LCS Problem

## Definition

LCS between two strings $X$ and $Y$ is the length of longest common subsequence between $\boldsymbol{X}$ and $\boldsymbol{Y}$.

## Example

LCS between ABAZDC and BACBAD is

## LCS Problem

## Definition

LCS between two strings $X$ and $Y$ is the length of longest common subsequence between $X$ and $Y$.

## Example

LCS between ABAZDC and BACBAD is 4 via ABAD

## LCS Problem

## Definition

LCS between two strings $X$ and $Y$ is the length of longest common subsequence between $\boldsymbol{X}$ and $\boldsymbol{Y}$.

## Example

LCS between ABAZDC and BACBAD is 4 via ABAD
Derive a dynamic programming algorithm for the problem.

## Part III

## Maximum Weighted Independent Set in Trees

## Maximum Weight Independent Set Problem

Input Graph $\boldsymbol{G}=(\boldsymbol{V}, \boldsymbol{E})$ and weights $\boldsymbol{w}(\boldsymbol{v}) \geq 0$ for each $v \in V$
Goal Find maximum weight independent set in $G$

## Maximum Weight Independent Set Problem

```
Input Graph \(G=(\boldsymbol{V}, \boldsymbol{E})\) and weights \(\boldsymbol{w}(\boldsymbol{v}) \geq 0\) for each \(v \in V\)
```

Goal Find maximum weight independent set in $G$

Maximum weight independent set in above graph: $\{B, D\}$

## Maximum Weight Independent Set in a

## Tree

$$
\begin{aligned}
& \text { Input } \text { Tree } \boldsymbol{T}=(V, E) \text { and weights } w(v) \geq 0 \text { for each } \\
& v \in V
\end{aligned}
$$

Goal Find maximum weight independent set in $T$

Maximum weight independent set in above tree: ??

## Towards a Recursive Solution

For an arbitrary graph $G$ :
(1) Number vertices as $v_{1}, v_{2}, \ldots, v_{n}$
(2) Find recursively optimum solutions without $v_{n}$ (recurse on $G-\boldsymbol{v}_{\boldsymbol{n}}$ ) and with $\boldsymbol{v}_{\boldsymbol{n}}$ (recurse on $G-\boldsymbol{v}_{\boldsymbol{n}}-N\left(\boldsymbol{v}_{\boldsymbol{n}}\right)$ \& include $v_{n}$ ).
(3) Saw that if graph $G$ is arbitrary there was no good ordering that resulted in a small number of subproblems.

## Towards a Recursive Solution

For an arbitrary graph $G$ :
(1) Number vertices as $v_{1}, v_{2}, \ldots, v_{n}$
(2) Find recursively optimum solutions without $v_{n}$ (recurse on $G-\boldsymbol{v}_{\boldsymbol{n}}$ ) and with $\boldsymbol{v}_{\boldsymbol{n}}$ (recurse on $G-\boldsymbol{v}_{\boldsymbol{n}}-N\left(\boldsymbol{v}_{\boldsymbol{n}}\right)$ \& include $v_{n}$ ).
(3) Saw that if graph $G$ is arbitrary there was no good ordering that resulted in a small number of subproblems.

What about a tree?

## Towards a Recursive Solution

For an arbitrary graph $G$ :
(1) Number vertices as $v_{1}, v_{2}, \ldots, v_{n}$
(2) Find recursively optimum solutions without $v_{n}$ (recurse on $G-v_{n}$ ) and with $\boldsymbol{v}_{\boldsymbol{n}}$ (recurse on $G-\boldsymbol{v}_{\boldsymbol{n}}-N\left(\boldsymbol{v}_{\boldsymbol{n}}\right)$ \& include $v_{n}$ ).
(3) Saw that if graph $G$ is arbitrary there was no good ordering that resulted in a small number of subproblems.

What about a tree? Natural candidate for $v_{\boldsymbol{n}}$ is root $\boldsymbol{r}$ of $\boldsymbol{T}$ ?

## Towards a Recursive Solution

Natural candidate for $\boldsymbol{v}_{\boldsymbol{n}}$ is root $\boldsymbol{r}$ of $\boldsymbol{T}$ ? Let $\mathcal{O}$ be an optimum solution to the whole problem.
Case $\boldsymbol{r} \notin \mathcal{O}$ : Then $\mathcal{O}$ contains an optimum solution for each subtree of $\boldsymbol{T}$ hanging at a child of $r$.

## Towards a Recursive Solution

Natural candidate for $\boldsymbol{v}_{\boldsymbol{n}}$ is root $\boldsymbol{r}$ of $\boldsymbol{T}$ ? Let $\mathcal{O}$ be an optimum solution to the whole problem.
Case $\boldsymbol{r} \notin \mathcal{O}$ : Then $\mathcal{O}$ contains an optimum solution for each subtree of $T$ hanging at a child of $r$.
Case $r \in \mathcal{O}$ : None of the children of $r$ can be in $\mathcal{O} . \mathcal{O}-\{r\}$ contains an optimum solution for each subtree of $\boldsymbol{T}$ hanging at a grandchild of $r$.

## Towards a Recursive Solution

Natural candidate for $\boldsymbol{v}_{\boldsymbol{n}}$ is root $\boldsymbol{r}$ of $\boldsymbol{T}$ ? Let $\mathcal{O}$ be an optimum solution to the whole problem.
Case $\boldsymbol{r} \notin \mathcal{O}$ : Then $\mathcal{O}$ contains an optimum solution for each subtree of $T$ hanging at a child of $r$.
Case $r \in \mathcal{O}$ : None of the children of $r$ can be in $\mathcal{O} . \mathcal{O}-\{r\}$ contains an optimum solution for each subtree of $T$ hanging at a grandchild of $r$.

Subproblems? Subtrees of $\boldsymbol{T}$ rooted at nodes in $\boldsymbol{T}$.

## Towards a Recursive Solution

Natural candidate for $\boldsymbol{v}_{\boldsymbol{n}}$ is root $\boldsymbol{r}$ of $\boldsymbol{T}$ ? Let $\mathcal{O}$ be an optimum solution to the whole problem.
Case $\boldsymbol{r} \notin \mathcal{O}$ : Then $\mathcal{O}$ contains an optimum solution for each subtree of $T$ hanging at a child of $r$.
Case $r \in \mathcal{O}$ : None of the children of $r$ can be in $\mathcal{O} . \mathcal{O}-\{r\}$ contains an optimum solution for each subtree of $T$ hanging at a grandchild of $r$.

Subproblems? Subtrees of $\boldsymbol{T}$ rooted at nodes in $\boldsymbol{T}$.

How many of them?

## Towards a Recursive Solution

Natural candidate for $\boldsymbol{v}_{\boldsymbol{n}}$ is root $\boldsymbol{r}$ of $\boldsymbol{T}$ ? Let $\mathcal{O}$ be an optimum solution to the whole problem.
Case $r \notin \mathcal{O}$ : Then $\mathcal{O}$ contains an optimum solution for each subtree of $T$ hanging at a child of $r$.

Subproblems? Subtrees of $\boldsymbol{T}$ rooted at nodes in $\boldsymbol{T}$.
How many of them? $O(n)$

## Example

## A Recursive Solution

$\boldsymbol{T}(\boldsymbol{u})$ : subtree of $\boldsymbol{T}$ hanging at node $\boldsymbol{u}$
MaxIndSet(u): max weighted independent set value in $\boldsymbol{T}(\boldsymbol{u})$

## MaxIndSet(u)=

## A Recursive Solution

$\boldsymbol{T}(\boldsymbol{u})$ : subtree of $\boldsymbol{T}$ hanging at node $\boldsymbol{u}$
MaxIndSet(u): max weighted independent set value in $\boldsymbol{T}(\boldsymbol{u})$
$\operatorname{MaxIndSet}(u)=\max \left\{\begin{array}{l}\sum_{v} \text { child of } u \operatorname{MaxIndSet}(v), \\ w(u)+\sum_{v} \text { grandchild of } u \operatorname{MaxIndSet}(v)\end{array}\right.$

## Iterative Algorithm

(1) Compute MaxIndSet(u) bottom up. To evaluate MaxIndSet(u) need to have computed values of all children and grandchildren of $\boldsymbol{u}$
(2) What is an ordering of nodes of a tree $T$ to achieve above?

## Iterative Algorithm

(1) Compute MaxIndSet(u) bottom up. To evaluate MaxIndSet( $\boldsymbol{u})$ need to have computed values of all children and grandchildren of $\boldsymbol{u}$
(2) What is an ordering of nodes of a tree $T$ to achieve above? Post-order traversal of a tree.

## Iterative Algorithm

## MIS-Tree ( $\boldsymbol{T}$ ) :

Let $\boldsymbol{v}_{1}, \boldsymbol{v}_{2}, \ldots, \boldsymbol{v}_{\boldsymbol{n}}$ be a post-order traversal of nodes of T for $\boldsymbol{i}=1$ to $\boldsymbol{n}$ do

$$
\boldsymbol{M}\left[\boldsymbol{v}_{i}\right]=\max \binom{\sum_{\boldsymbol{v}_{j} \text { child of } \boldsymbol{v}_{i}} \boldsymbol{M}\left[\boldsymbol{v}_{j}\right],}{\boldsymbol{w}\left(\boldsymbol{v}_{\boldsymbol{i}}\right)+\sum_{\boldsymbol{v}_{j} \text { grandchild of } \boldsymbol{v}_{i}} \boldsymbol{M}\left[\boldsymbol{v}_{j}\right]}
$$

return $M\left[v_{n}\right]$ (* Note: $\boldsymbol{v}_{\boldsymbol{n}}$ is the root of $\boldsymbol{T} *$ )

## Iterative Algorithm

## MIS-Tree ( $\boldsymbol{T}$ ) :

Let $\boldsymbol{v}_{1}, \boldsymbol{v}_{2}, \ldots, \boldsymbol{v}_{\boldsymbol{n}}$ be a post-order traversal of nodes of T for $\boldsymbol{i}=1$ to $\boldsymbol{n}$ do

$$
\boldsymbol{M}\left[\boldsymbol{v}_{i}\right]=\max \binom{\sum_{\boldsymbol{v}_{j} \text { child of } \boldsymbol{v}_{i}} \boldsymbol{M}\left[\boldsymbol{v}_{j}\right],}{\boldsymbol{w}\left(\boldsymbol{v}_{\boldsymbol{i}}\right)+\sum_{\boldsymbol{v}_{j} \text { grandchild of } \boldsymbol{v}_{i}} \boldsymbol{M}\left[\boldsymbol{v}_{j}\right]}
$$

return $\boldsymbol{M}\left[\boldsymbol{v}_{\boldsymbol{n}}\right]$ (* Note: $\boldsymbol{v}_{\boldsymbol{n}}$ is the root of $\boldsymbol{T} *$ )

## Space:

## Iterative Algorithm

## MIS-Tree ( $\boldsymbol{T}$ ) :

Let $\boldsymbol{v}_{1}, \boldsymbol{v}_{2}, \ldots, \boldsymbol{v}_{\boldsymbol{n}}$ be a post-order traversal of nodes of T for $\boldsymbol{i}=1$ to $\boldsymbol{n}$ do

$$
\boldsymbol{M}\left[\boldsymbol{v}_{i}\right]=\max \binom{\sum_{\boldsymbol{v}_{j} \text { child of } \boldsymbol{v}_{i}} \boldsymbol{M}\left[\boldsymbol{v}_{j}\right],}{\boldsymbol{w}\left(\boldsymbol{v}_{\boldsymbol{i}}\right)+\sum_{\boldsymbol{v}_{j} \text { grandchild of } \boldsymbol{v}_{i}} \boldsymbol{M}\left[\boldsymbol{v}_{j}\right]}
$$

return $M\left[v_{n}\right]$ (* Note: $v_{n}$ is the root of $\boldsymbol{T} *$ )
Space: $\boldsymbol{O}(\boldsymbol{n})$ to store the value at each node of $\boldsymbol{T}$ Running time:

## Iterative Algorithm

MIS-Tree ( $\boldsymbol{T}$ ) :
Let $\boldsymbol{v}_{1}, \boldsymbol{v}_{2}, \ldots, \boldsymbol{v}_{\boldsymbol{n}}$ be a post-order traversal of nodes of T for $\boldsymbol{i}=1$ to $\boldsymbol{n}$ do

$$
\boldsymbol{M}\left[\boldsymbol{v}_{i}\right]=\max \binom{\sum_{\boldsymbol{v}_{j} \text { child of } \boldsymbol{v}_{i}} \boldsymbol{M}\left[\boldsymbol{v}_{j}\right],}{\boldsymbol{w}\left(\boldsymbol{v}_{\boldsymbol{i}}\right)+\sum_{\boldsymbol{v}_{j} \text { grandchild of } \boldsymbol{v}_{i}} \boldsymbol{M}\left[\boldsymbol{v}_{j}\right]}
$$

return $M\left[v_{n}\right]$ (* Note: $v_{n}$ is the root of $\boldsymbol{T} *$ )
Space: $\boldsymbol{O}(\boldsymbol{n})$ to store the value at each node of $\boldsymbol{T}$
Running time:
(1) Naive bound: $O\left(n^{2}\right)$ since each $M\left[v_{i}\right]$ evaluation may take $O(n)$ time and there are $n$ evaluations.

## Iterative Algorithm

## MIS-Tree ( $\boldsymbol{T}$ ) :

Let $\boldsymbol{v}_{1}, \boldsymbol{v}_{2}, \ldots, \boldsymbol{v}_{\boldsymbol{n}}$ be a post-order traversal of nodes of T for $\boldsymbol{i}=1$ to $\boldsymbol{n}$ do

$$
\boldsymbol{M}\left[\boldsymbol{v}_{i}\right]=\max \binom{\sum_{\boldsymbol{v}_{j} \text { child of } \boldsymbol{v}_{i}} \boldsymbol{M}\left[\boldsymbol{v}_{j}\right],}{\boldsymbol{w}\left(\boldsymbol{v}_{\boldsymbol{i}}\right)+\sum_{\boldsymbol{v}_{j} \text { grandchild of } \boldsymbol{v}_{i}} \boldsymbol{M}\left[\boldsymbol{v}_{j}\right]}
$$

return $M\left[v_{n}\right]$ (* Note: $v_{\boldsymbol{n}}$ is the root of $\boldsymbol{T} *$ )
Space: $\boldsymbol{O}(\boldsymbol{n})$ to store the value at each node of $\boldsymbol{T}$
Running time:
(1) Naive bound: $O\left(n^{2}\right)$ since each $M\left[v_{i}\right]$ evaluation may take $O(n)$ time and there are $n$ evaluations.
(2) Better bound: $O(n)$. A value $M\left[v_{j}\right]$ is accessed only by its parent and grand parent.

## Example

## Takeaway Points

(1) Dynamic programming is based on finding a recursive way to solve the problem. Need a recursion that generates a small number of subproblems.
(2) Given a recursive algorithm there is a natural DAG associated with the subproblems that are generated for given instance; this is the dependency graph. An iterative algorithm simply evaluates the subproblems in some topological sort of this DAG.
(3) The space required to evaluate the answer can be reduced in some cases by a careful examination of that dependency DAG of the subproblems and keeping only a subset of the DAG at any time.
