## CS/ECE 374: Algorithms \& Models of Computation

## Undecidability and Reductions

Lecture 21
April 13, 2023

## Part I

## TM Recap and Recursive/Decidable Languages

## Turing Machine

- DFA with infinite tap
- One move: read, write, move one cell, change state

## Turing Machine

- DFA with infinite tap
- One move: read, write, move one cell, change state

On a given input string $w$ a TM $M$ does one of the following:

- halt and accept $w$
- halt and reject $w$
- go into an infinite loop (not halt)
- crash in which case we think of it as rejecting w

## Recursive and Recursively Enumerable

## Definition

Given TM $M, L(M)=\left\{w \in \Sigma^{*} \mid M\right.$ accepts $\left.w\right\}$.
We say $M$ accepts $L$.
Caveat: A language $L$ can be accepted by many different TMs.

## Recursive and Recursively Enumerable

## Definition

Given TM $M, L(M)=\left\{w \in \Sigma^{*} \mid M\right.$ accepts $\left.w\right\}$. We say $M$ accepts $L$.

Caveat: A language $L$ can be accepted by many different TMs.

## Definition

$M$ is an algorithm if it halts on every input and accepts/rejects.

## Recursive and Recursively Enumerable

## Definition

Given TM $M, L(M)=\left\{w \in \Sigma^{*} \mid M\right.$ accepts $\left.w\right\}$. We say $M$ accepts $L$.

Caveat: A language $L$ can be accepted by many different TMs.

## Definition

$M$ is an algorithm if it halts on every input and accepts/rejects.

## Definition

A language $L$ is decidable (or recursive) if there is an algorithm $M$ such that $L=L(M)$.

## Recursive and Recursively Enumerable

## Definition

Given TM $M, L(M)=\left\{w \in \Sigma^{*} \mid M\right.$ accepts $\left.w\right\}$. We say $M$ accepts $L$.

Caveat: A language $L$ can be accepted by many different TMs.

## Definition

$M$ is an algorithm if it halts on every input and accepts/rejects.

## Definition

A language $L$ is decidable (or recursive) if there is an algorithm $M$ such that $L=L(M)$.

## Definition

A language $L$ is recursively enumerable if there is a TM $M$ such that $L=L(M)$.

## Recursive and Recursively Enumerable

- If $L$ is recursive then $\bar{L}=\Sigma^{*}-L$ is also recursive
- If $L$ is recursive then $L$ is r.e.

## Recursive and Recursively Enumerable

- If $L$ is recursive then $\bar{L}=\Sigma^{*}-L$ is also recursive
- If $L$ is recursive then $L$ is r.e.
- Suppose $L$ is r.e. $L=L(M)$ for some $M$.
- If $\boldsymbol{w} \in \boldsymbol{L}$ then $\boldsymbol{M}$ halts and accepts $\boldsymbol{w}$.

## Recursive and Recursively Enumerable

- If $L$ is recursive then $\bar{L}=\Sigma^{*}-L$ is also recursive
- If $L$ is recursive then $L$ is r.e.
- Suppose $L$ is r.e. $L=L(M)$ for some $M$.
- If $\boldsymbol{w} \in \boldsymbol{L}$ then $\boldsymbol{M}$ halts and accepts $\boldsymbol{w}$.
- If $\boldsymbol{w} \notin L$ then

## Recursive and Recursively Enumerable

- If $L$ is recursive then $\bar{L}=\Sigma^{*}-L$ is also recursive
- If $L$ is recursive then $L$ is r.e.
- Suppose $L$ is r.e. $L=L(M)$ for some $M$.
- If $\boldsymbol{w} \in \boldsymbol{L}$ then $\boldsymbol{M}$ halts and accepts $\boldsymbol{w}$.
- If $\boldsymbol{w} \notin \boldsymbol{L}$ then $\boldsymbol{M}$ may or may not halt! If $\boldsymbol{M}$ halts then it rejects $\boldsymbol{w}$.

## Recursive and Recursively Enumerable

- If $L$ is recursive then $\bar{L}=\Sigma^{*}-L$ is also recursive
- If $L$ is recursive then $L$ is r.e.
- Suppose $L$ is r.e. $L=L(M)$ for some $M$.
- If $\boldsymbol{w} \in \boldsymbol{L}$ then $\boldsymbol{M}$ halts and accepts $\boldsymbol{w}$.
- If $\boldsymbol{w} \notin \boldsymbol{L}$ then $\boldsymbol{M}$ may or may not halt! If $\boldsymbol{M}$ halts then it rejects $\boldsymbol{w}$.

Question: Are r.e languages interesting? And why?

- Technical/mathematical reasons
- Pragmatic reasons. We are used to programs that are correct, but are willing to give up on efficiency/halting.

## Recursive and Recursively Enumerable

- If $L$ is recursive then $\bar{L}=\Sigma^{*}-L$ is also recursive
- If $L$ is recursive then $L$ is r.e.
- Suppose $L$ is r.e. $L=L(M)$ for some $M$.
- If $\boldsymbol{w} \in \boldsymbol{L}$ then $\boldsymbol{M}$ halts and accepts $\boldsymbol{w}$.
- If $\boldsymbol{w} \notin \boldsymbol{L}$ then $\boldsymbol{M}$ may or may not halt! If $\boldsymbol{M}$ halts then it rejects $\boldsymbol{w}$.

Question: Are r.e languages interesting? And why?

- Technical/mathematical reasons
- Pragmatic reasons. We are used to programs that are correct, but are willing to give up on efficiency/halting.

## Definition

$L$ is undecidable if there is no algorithm $M$ such that $L=L(M)$. $L$ is not r.e if there is no TM $M$ such that $L=L(M)$.

## Universal TM

A single TM that can simulate other TMs. Basis of modern computers. Single computer that runs many different programs.

- UTM takes as input $\langle\boldsymbol{M}\rangle$ (encoding of a TM $M$ ) and a string $w$. Typically written as $\langle M, w\rangle$.

## Universal TM

A single TM that can simulate other TMs. Basis of modern computers. Single computer that runs many different programs.

- UTM takes as input $\langle\boldsymbol{M}\rangle$ (encoding of a TM $M$ ) and a string $w$. Typically written as $\langle M, w\rangle$.
- UTM simulates $M$ on $w$.
- If $\boldsymbol{M}$ accepts $\boldsymbol{w}$ then UTM accepts its input $\langle\boldsymbol{M}, \boldsymbol{w}\rangle$.
- If $\boldsymbol{M}$ halts and rejects $\boldsymbol{w}$ then UTM rejects its input $\langle\boldsymbol{M}, \boldsymbol{w}\rangle$.
- If $\boldsymbol{M}$ does not halt on $\boldsymbol{w}$ then UTM also does not halt on input $\langle\boldsymbol{M}, \boldsymbol{w}\rangle$ and hence does not accept its input.

## Universal TM

A single TM that can simulate other TMs. Basis of modern computers. Single computer that runs many different programs.

- UTM takes as input $\langle M\rangle$ (encoding of a TM $M$ ) and a string $w$. Typically written as $\langle M, w\rangle$.
- UTM simulates $M$ on $w$.
- If $\boldsymbol{M}$ accepts $\boldsymbol{w}$ then UTM accepts its input $\langle\boldsymbol{M}, \boldsymbol{w}\rangle$.
- If $\boldsymbol{M}$ halts and rejects $\boldsymbol{w}$ then UTM rejects its input $\langle\boldsymbol{M}, \boldsymbol{w}\rangle$.
- If $\boldsymbol{M}$ does not halt on $\boldsymbol{w}$ then UTM also does not halt on input $\langle\boldsymbol{M}, \boldsymbol{w}\rangle$ and hence does not accept its input.
- What is the language of UTM? Special name called Universal Language denote by $L_{u}$.

$$
L_{u}=\{\langle M, w\rangle \mid M \text { accepts } w .\}
$$

## Encoding TMs

## Observation

There is a fixed encoding such that every TM M can be represented as a unique binary string.

Equivalently we think of a TM as simply a program which is a string.
For each string that is not a valid encoding we associate a dummy TM that does not accept any string. Why?

## Encoding TMs

## Observation

There is a fixed encoding such that every TM M can be represented as a unique binary string.

Equivalently we think of a TM as simply a program which is a string.
For each string that is not a valid encoding we associate a dummy TM that does not accept any string. Why?

One-to-one correspondence between binary strings and TMs.
$M_{\boldsymbol{i}}$ is the the TM associate with integer $\boldsymbol{i}$

## How many TMs?

One-to-one correspondence between integers and TMs.

## Proposition

The number of TMs is countably infinite.

## How many TMs?

One-to-one correspondence between integers and TMs.

## Proposition

The number of TMs is countably infinite.
Easy but important corollaries:

- Hence, countably infinite number of r.e (hence also recursive) languages
- Number of languages is uncountably infinite! Hence there must be languages that are not r.e/recursive and hence undecidable! In fact, most langauges are undecidable!

## How many TMs?

One-to-one correspondence between integers and TMs.

## Proposition

The number of TMs is countably infinite.
Easy but important corollaries:

- Hence, countably infinite number of r.e (hence also recursive) languages
- Number of languages is uncountably infinite! Hence there must be languages that are not r.e/recursive and hence undecidable! In fact, most langauges are undecidable!
Question: Which interesting languages are undecidable/not r.e?

## Part II

## Undecidable Languages and Proofs via Reductions

## Undecidable Languages

Counting argument shows that too many languages and too few $\mathrm{TMs} /$ programs hence most languages are not decidable.

What "real-world" and "natural" languages are undecidable?

Short answer: reasoning about general programs is difficult.

## Undecidable Languages

Counting argument shows that too many languages and too few $\mathrm{TMs} /$ programs hence most languages are not decidable.

What "real-world" and "natural" languages are undecidable?
Short answer: reasoning about general programs is difficult.

## Theorem (Turing)

Following languages are undecidable.

- $L_{\text {HaLt }}=\{\langle M\rangle \mid M$ halts on blank input $\}$
- $L_{\text {halt }, w}=\{\langle M, w\rangle \mid M$ halts on input $w\}$
- $L_{u}=\{\langle M, w\rangle \mid M$ accepts $w\}$

Recall that languages are problems. Jeff's notes calls Halting problem HALT (the second version)

## What else is undecidable?

Via (sometimes highly non-trivial) reductions one can show

- Essentially many questions about sufficiently general programs are undecidable
- Many problems in mathematical logic are undecidable
- Posts correspondence problem which is a string problem
- Tiling problems
- Problems in mathematics such as Diophantine equation solution (Hilbert's 10th problem)
Undecidablity connects computation to mathematics/logic and proofs

## What do we want you to know?

- The core undecidable problems (HALT and $L_{u}$ )
- Ability to do simple reductions that prove undecidability of program behaviour

## Reductions

(1) $\mathcal{R}$ : Reduction $X \rightarrow Y$
(2) $\mathcal{A}_{Y}$ : algorithm for $Y$ :
(3) $\Longrightarrow$ New algorithm for $\boldsymbol{X}$ :

We write $X \leq Y$ if $\boldsymbol{X}$ reduces to $\boldsymbol{Y}$

## Lemma

If $X \leq Y$ and $X$ is undecidable then $Y$ is undecidable.

## CS 125 assignment

Write a program that prints "Hello World"

```
main() {
    print(''Hello World'')
}
```

## CS 125 assignment

Write a program that prints "Hello World"

```
main() {
    print(''Hello World'')
}
```

Question: Can we create an autograder?

## CS 125 assignment

Write a program that prints "Hello World"

```
main() {
    print(''Hello World'')
}
```

Question: Can we create an autograder? No! Why?

```
main() {
    stealthcode()
    print(''Hello World'')
}
stealthcode() {
    do this
    do that
    viola
}
```

## Reducing Halting to Autograder

- Halting problem: given arbitrary program foo(), does it halt?

## Reducing Halting to Autograder

- Halting problem: given arbitrary program foo(), does it halt?
- Reduction to CS125Autograder: given foo() output foobar()

Note: Reduction only needs to add a few lines of code to foo()

## Reducing Halting to Autograder

- Halting problem: given arbitrary program foo(), does it halt?
- Reduction to CS125Autograder: given foo() output foobar()

Note: Reduction only needs to add a few lines of code to foo()

- foobar() prints "Hello World" if and only if foo() halts!
- If we had CS125Autograder then we can solve Halting. But Halting is hard according to Turing. Hence ...

## Reducing Halting to Autograder

HALT Decider

## Connection to proofs

Goldbach's conjecture: Every even integer $\geq 4$ can be written as sum of two primes. Made in 1742, still open.

## Connection to proofs

Goldbach's conjecture: Every even integer $\geq 4$ can be written as sum of two primes. Made in 1742, still open.

If Halting can be solved then can solve Goldbach's conjecture. How? Can write a program that halts if and only if conjecture is false.

```
golbach() \{
    \(\boldsymbol{n}=4\)
    repeat
        flag \(=\) FALSE
        for (int \(\boldsymbol{i}=2, \boldsymbol{i}<\boldsymbol{n} ; \boldsymbol{i}++\) ) do
        If (i) and \((\boldsymbol{n}-\boldsymbol{i})\) are both prime)
                        flag = TRUE; Break
    If (!flag) return ''Goldbach's Conjecture is False')
    \(\boldsymbol{n}=\boldsymbol{n}+2\)
    Until (TRUE)
\}
```

## More reduction about languages

We will show following languages about program behaviour are undecidable.

- $L_{374}=\left\{\langle M\rangle \mid L(M)=\left\{0^{374}\right\}\right\}$
- $L_{\neq \emptyset}=\{\langle M\rangle \mid L(M) \neq \emptyset\}$
- a template to show that essentially checking whether a given program's language satisfies some non-trivial property is undecidable

Same proof technique as the one for autograder

## Undecidability of $L_{374}$

## Understanding: What is the problem of deciding $L_{374}$ ?

Given an arbitrary program boo(str w) does boo() accept only the string $0^{374}$ and nothing else?

## Undecidability of $L_{374}$

Understanding: What is the problem of deciding $L_{374}$ ?
Given an arbitrary program boo(str w) does boo() accept only the string $0^{374}$ and nothing else?

Seems harder than autograder for printing "Hello World"!

## Undecidability of $L_{374}$

Understanding: What is the problem of deciding $L_{374}$ ?
Given an arbitrary program boo(str w) does boo() accept only the string $0^{374}$ and nothing else?

Seems harder than autograder for printing "Hello World"!

Prove that if we had a decider Decide $L_{374}$ for $L_{374}$ then we can create a decider for HALT.

## Undecidability of $L_{374}$

Understanding: What is the problem of deciding $L_{374}$ ?
Given an arbitrary program boo(str w) does boo() accept only the string $0^{374}$ and nothing else?

Seems harder than autograder for printing "Hello World"!

Prove that if we had a decider Decide $L_{374}$ for $L_{374}$ then we can create a decider for HALT.

Recall: Decider for HALT takes an arbitrary program foo() and needs to check if $f \circ \boldsymbol{O}()$ halts.

## Undecidability of $L_{374}$

Understanding: What is the problem of deciding $L_{374}$ ?

Given an arbitrary program boo(str w) does boo() accept only the string $0^{374}$ and nothing else?

Seems harder than autograder for printing "Hello World"!

Prove that if we had a decider Decide $L_{374}$ for $L_{374}$ then we can create a decider for HALT.

Recall: Decider for HALT takes an arbitrary program foo() and needs to check if $f \circ o()$ halts.
Reduction should transform foo() into a program fooboo() such that answer to $\operatorname{fooboo}()$ from Decide $L_{374}$ will let us know if $f o \boldsymbol{O}()$ halts.

## Undecidability of $L_{374}$

A simple program simpleboo(str w)

```
simpleboo(str w) {
    if (w}=\mp@subsup{0}{}{374})\mathrm{ then return YES
    return NO
}
```

Easy to see that $L($ simpleboo ()$)=\left\{0^{374}\right\}$.

## Undecidability of $L_{374}$

A simple program simpleboo(str w)

```
simpleboo(str w) {
    if ( }\boldsymbol{w}=\mp@subsup{0}{}{374}\mathrm{ ) then return YES
    return NO
}
```

Easy to see that $L($ simpleboo ()$)=\left\{0^{374}\right\}$.
Given arbitrary program foo() reduction creates fooboo(str w):

```
fooboo(str w) {
    foo()
    if (w}=\mp@subsup{0}{}{374})\mathrm{ then Return YES
    return NO
}
foo () {
code of foo ...
}
```

## Undecidability of $L_{374}$

## Lemma

Language of fooboo() is $\left\{0^{374}\right\}$ if foo() halts. Language of fooboo() is $\emptyset$ if foo() does not halt.

## Undecidability of $L_{374}$

## Lemma

Language of fooboo() is $\left\{0^{374}\right\}$ if foo() halts. Language of fooboo() is $\emptyset$ if foo() does not halt.

## Corollary

fooboo() in $L_{374}$ if and only if $f o \boldsymbol{O}() \in L_{\text {HALT }}$.

## Corollary

If $L_{374}$ is decidable then $L_{\text {HALT }}$ is decidable. Since $L_{\text {HALT }}$ is undecidable $\boldsymbol{L}_{374}$ is undecidable.

## Undecidability of $L_{\neq \emptyset}$

Understanding: What is the problem of deciding $L_{\neq \emptyset}$ ?
Given an arbitrary program boo(str w) does boo() accept any string?

## Undecidability of $L_{\neq \emptyset}$

Understanding: What is the problem of deciding $L_{\neq \emptyset}$ ?
Given an arbitrary program boo(str w) does boo() accept any string?

Reduce from HALT: given arbitrary program foo() create fooboo() such that fooboo() accepts some string iff foo() halts.

## Undecidability of $L_{\neq \emptyset}$

A simple program simpleboo(str w)

```
simpeboo(str w) {
return YES
}
```

Easy to see that $L($ simpleboo ()$)=\Sigma^{*}$ and hence not empty.

## Undecidability of $L_{\neq \emptyset}$

A simple program simpleboo(str w)

```
simpeboo(str w) {
return YES
}
```

Easy to see that $L($ simpleboo ()$)=\Sigma^{*}$ and hence not empty.
Given arbitrary program foo(), reduction creates fooboo(str w):

```
fooboo(str w) {
        foo()
        return YES
}
foo() {
code of foo ...
}
```

## Undecidability of $L_{\neq \emptyset}$

## Lemma

Language of fooboo() is $\Sigma^{*}$ if $f 00()$ halts. Language of fooboo() is $\emptyset$ if $f 00()$ does not halt.

## Undecidability of $L_{\neq \emptyset}$

## Lemma

Language of fooboo() is $\Sigma^{*}$ if foo() halts. Language of fooboo() is $\emptyset$ if foo() does not halt.

Corollary<br>fooboo() in $L_{\neq \emptyset}$ if and only if $f \circ o() \in L_{\text {HALT }}$.

## Beyond r.e

## Lemma

If $L$ is recursive then $\bar{L}=\Sigma^{*}-L$ is recursive.

## Beyond r.e

## Lemma

If $L$ is recursive then $\bar{L}=\Sigma^{*}-L$ is recursive.

## Lemma

Suppose $L$ and $\bar{L}$ are both r.e. Then $L$ is recursive.

## Beyond r.e

## Lemma

If $L$ is recursive then $\bar{L}=\Sigma^{*}-L$ is recursive.

## Lemma

Suppose $L$ and $\bar{L}$ are both r.e. Then $L$ is recursive.

## Proof.

We have TMs $M, M^{\prime}$ such that $L=L(M)$ and $\bar{L}=L\left(M^{\prime}\right)$.
Construct new TM $M^{*}$ that on input $w$ simulates both $M$ and $M^{\prime}$ on $w$ in parallel. One of them has to halt and give right answer.

## Beyond r.e

## Lemma

If $L$ is recursive then $\bar{L}=\Sigma^{*}-L$ is recursive.

## Lemma

Suppose $L$ and $\bar{L}$ are both r.e. Then $L$ is recursive.

## Proof.

We have TMs $M, M^{\prime}$ such that $L=L(M)$ and $\bar{L}=L\left(M^{\prime}\right)$.
Construct new TM $M^{*}$ that on input $w$ simulates both $M$ and $M^{\prime}$ on $w$ in parallel. One of them has to halt and give right answer.

## Corollary

Suppose $L$ is r.e but not recursive. Then $\bar{L}$ is not r.e.

## Beyond r.e

## Corollary

Suppose $L$ is r.e but not recursive. Then $\bar{L}$ is not r.e.
Thus $\overline{L_{\text {HALT }}}$ and $\overline{L_{u}}$ are not even r.e. What does this mean?

## Beyond r.e

## Corollary

Suppose $L$ is r.e but not recursive. Then $\bar{L}$ is not r.e.
Thus $\overline{L_{H A L T}}$ and $\overline{L_{u}}$ are not even r.e. What does this mean?
What problem is $\overline{L_{\text {HALT }}}$ ? Given code/program $\langle M\rangle$ does it not halt on blank input? How can we tell?

We can simulate $M$ using a UTM. How long? If $M$ halts during simulation, UTM can reject $\langle M\rangle$. But if it does not halt after a billion steps can we stop simulation and say for sure that $M$ will not halt? Perhaps there are other ways of figuring this out? Proof says no.

## Part III

## Undecidablity of Halting

## Turing's Theorem

## Theorem (Turing)

Following languages are undecidable.

- $L_{\text {HALt }}=\{\langle M\rangle \mid M$ halts on blank input $\}$
- $L_{\text {HALT }, w}=\{\langle M, w\rangle \mid M$ halts on input $w\}$
- $L_{u}=\{\langle M, w\rangle \mid M$ accepts $w\}$

Exercise: Prove that the above languages can be reduced to each other.

## Turing's Theorem

## Theorem (Turing)

Following languages are undecidable.

- $L_{\text {HALt }}=\{\langle M\rangle \mid M$ halts on blank input $\}$
- $L_{\text {HALT }, w}=\{\langle M, w\rangle \mid M$ halts on input $w\}$
- $L_{u}=\{\langle M, w\rangle \mid M$ accepts $w\}$

Exercise: Prove that the above languages can be reduced to each other.

Two proofs

- A two step one based on Cantor's diagonalization
- A slick one but essentially the same idea in a different fashion

## Diagonalization based proof

TMs can be put in 1-1 correspondence with integers: $M_{\boldsymbol{i}}$ is $\boldsymbol{i}$ 'th TM

## Definition

$L_{\boldsymbol{d}}=\left\{\langle\boldsymbol{i}\rangle \mid M_{\boldsymbol{i}}\right.$ does not accept $\left.\langle\boldsymbol{i}\rangle\right\}$. Same as
$L_{\boldsymbol{d}}=\left\{\left\langle M_{\boldsymbol{i}}\right\rangle \mid M_{\boldsymbol{i}}\right.$ does not accept $\left.\langle\boldsymbol{i}\rangle\right\}$.

## Understanding $L_{d}$

|  | $w_{0}$ | $w_{1}$ | $w_{2}$ | $w_{3}$ | $w_{4}$ | $w_{5}$ | $w_{6}$ | $w_{7}$ | $w_{8}$ | $w_{9}$ | $\ldots$ |

## $L_{d}$ is not r.e

$L_{\boldsymbol{d}}=\left\{\langle i\rangle \mid M_{\boldsymbol{i}}\right.$ does not accept $\left.\langle i\rangle\right\}$.
Theorem
$L_{d}$ is not r.e.

## $L_{d}$ is not r.e

$L_{\boldsymbol{d}}=\left\{\langle i\rangle \mid M_{\boldsymbol{i}}\right.$ does not accept $\left.\langle i\rangle\right\}$.

## Theorem

$L_{d}$ is not r.e.
Proof by contradiction. Suppose it is. Then there is some $\boldsymbol{i}^{*}$ such that $L_{d}=L\left(M_{i^{*}}\right)$.

## $L_{d}$ is not r.e

$L_{\boldsymbol{d}}=\left\{\langle i\rangle \mid M_{\boldsymbol{i}}\right.$ does not accept $\left.\langle i\rangle\right\}$.

## Theorem <br> $L_{d}$ is not r.e.

Proof by contradiction. Suppose it is. Then there is some $\boldsymbol{i}^{*}$ such that $L_{d}=L\left(M_{i^{*}}\right)$. Does $\left\langle i^{*}\right\rangle \in L_{d}$ ?

## $L_{d}$ is not r.e

$L_{\boldsymbol{d}}=\left\{\langle\boldsymbol{i}\rangle \mid M_{\boldsymbol{i}}\right.$ does not accept $\left.\langle\boldsymbol{i}\rangle\right\}$.

## Theorem

$L_{d}$ is not r.e.
Proof by contradiction. Suppose it is. Then there is some $\boldsymbol{i}^{*}$ such that $L_{\boldsymbol{d}}=\boldsymbol{L}\left(\mathbf{M}_{\boldsymbol{i}^{*}}\right)$. Does $\left\langle\boldsymbol{i}^{*}\right\rangle \in L_{\boldsymbol{d}}$ ?

- If yes then $\boldsymbol{M}_{\boldsymbol{i}^{*}}$ accepts $\left\langle\boldsymbol{i}^{*}\right\rangle$ since $\boldsymbol{L}_{\boldsymbol{d}}=\boldsymbol{L}\left(\boldsymbol{M}_{\boldsymbol{i}^{*}}\right)$. But this is a contradiction since $\left\langle i^{*}\right\rangle \notin L_{d}$ by definition of $L_{\boldsymbol{d}}$.

## $L_{d}$ is not r.e

$L_{\boldsymbol{d}}=\left\{\langle i\rangle \mid M_{\boldsymbol{i}}\right.$ does not accept $\left.\langle\boldsymbol{i}\rangle\right\}$.

## Theorem

$L_{\boldsymbol{d}}$ is not r.e.
Proof by contradiction. Suppose it is. Then there is some $\boldsymbol{i}^{*}$ such that $L_{\boldsymbol{d}}=\boldsymbol{L}\left(M_{\boldsymbol{i}^{*}}\right)$. Does $\left\langle i^{*}\right\rangle \in L_{\boldsymbol{d}}$ ?

- If yes then $\boldsymbol{M}_{\boldsymbol{i}^{*}}$ accepts $\left\langle\boldsymbol{i}^{*}\right\rangle$ since $\boldsymbol{L}_{\boldsymbol{d}}=\boldsymbol{L}\left(\boldsymbol{M}_{\boldsymbol{i}^{*}}\right)$. But this is a contradiction since $\left\langle i^{*}\right\rangle \notin L_{\boldsymbol{d}}$ by definition of $L_{\boldsymbol{d}}$.
- If no then $M_{\boldsymbol{i}^{*}}$ does not accept $\left\langle\boldsymbol{i}^{*}\right\rangle$ since $L_{\boldsymbol{d}}=L\left(M_{\boldsymbol{i}^{*}}\right)$. But this is a contradiction since $\left\langle i^{*}\right\rangle \in L_{\boldsymbol{d}}$ by definition of $L_{\boldsymbol{d}}$.

## $L_{d}$ is not r.e

$L_{\boldsymbol{d}}=\left\{\langle i\rangle \mid M_{\boldsymbol{i}}\right.$ does not accept $\left.\langle\boldsymbol{i}\rangle\right\}$.

## Theorem

$L_{\boldsymbol{d}}$ is not r.e.
Proof by contradiction. Suppose it is. Then there is some $\boldsymbol{i}^{*}$ such that $L_{\boldsymbol{d}}=\boldsymbol{L}\left(\mathbf{M}_{\boldsymbol{i}^{*}}\right)$. Does $\left\langle\boldsymbol{i}^{*}\right\rangle \in L_{\boldsymbol{d}}$ ?

- If yes then $\boldsymbol{M}_{\boldsymbol{i}^{*}}$ accepts $\left\langle\boldsymbol{i}^{*}\right\rangle$ since $\boldsymbol{L}_{\boldsymbol{d}}=\boldsymbol{L}\left(\boldsymbol{M}_{\boldsymbol{i}^{*}}\right)$. But this is a contradiction since $\left\langle i^{*}\right\rangle \notin L_{\boldsymbol{d}}$ by definition of $L_{\boldsymbol{d}}$.
- If no then $M_{\boldsymbol{i}^{*}}$ does not accept $\left\langle\boldsymbol{i}^{*}\right\rangle$ since $\boldsymbol{L}_{\boldsymbol{d}}=L\left(\boldsymbol{M}_{\boldsymbol{i}^{*}}\right)$. But this is a contradiction since $\left\langle i^{*}\right\rangle \in L_{\boldsymbol{d}}$ by definition of $L_{\boldsymbol{d}}$.
Thus we obtain a contradiction in both cases which implies that $\boldsymbol{L}_{\boldsymbol{d}}$ is not r.e.

## $L_{d}$ is not r.e implies $L_{u}$ is not decidable

## Lemma

$L_{d} \leq \overline{L_{u}}$. That is, if there is an algorithm for $\overline{L_{u}}$ then there is an algorithm for $\boldsymbol{L}_{\boldsymbol{d}}$. Equivalently, if there is an algorithm for $\boldsymbol{L}_{\boldsymbol{u}}$ then there is an algorithm for $\boldsymbol{L}_{\boldsymbol{d}}$.

## $L_{d}$ is not r.e implies $L_{u}$ is not decidable

## Lemma

$\boldsymbol{L}_{\boldsymbol{d}} \leq \overline{\bar{L}_{\boldsymbol{u}}}$. That is, if there is an algorithm for $\overline{\bar{L}_{\boldsymbol{u}}}$ then there is an algorithm for $\boldsymbol{L}_{\boldsymbol{d}}$. Equivalently, if there is an algorithm for $\boldsymbol{L}_{\boldsymbol{u}}$ then there is an algorithm for $\boldsymbol{L}_{\boldsymbol{d}}$.

Algorithm for $L_{\boldsymbol{d}}$ from an algorithm for $L_{\boldsymbol{u}}$ :

- Given $\langle i\rangle$ we simply feed $\left\langle M_{i}, i\right\rangle$ to algorithm for $L_{u}$
- If algorithm for $L_{u}$ says $N O$ return YES Else return NO

## $L_{d}$ is not r.e implies $L_{u}$ is not decidable

## Lemma

$\boldsymbol{L}_{\boldsymbol{d}} \leq \overline{\bar{L}_{\boldsymbol{u}}}$. That is, if there is an algorithm for $\overline{\bar{L}_{\boldsymbol{u}}}$ then there is an algorithm for $\boldsymbol{L}_{\boldsymbol{d}}$. Equivalently, if there is an algorithm for $\boldsymbol{L}_{\boldsymbol{u}}$ then there is an algorithm for $\boldsymbol{L}_{\boldsymbol{d}}$.

Algorithm for $\boldsymbol{L}_{\boldsymbol{d}}$ from an algorithm for $\boldsymbol{L}_{\boldsymbol{u}}$ :

- Given $\langle i\rangle$ we simply feed $\left\langle M_{i}, i\right\rangle$ to algorithm for $L_{u}$
- If algorithm for $L_{u}$ says $N O$ return YES Else return NO

## Corollary

$L_{u}$ is undecidable.

## Corollary

$L_{\text {HALT }}$ is undecidable.

## The Big Picture
