Normal Maps

1. Encoding Normals

Normal maps encode unit-length vectors in images as colors.

a. **Decode it**
Suppose you sample a normal map and get a color value of (0.5, 0, 0.75). What is the decoded normal?

b. **Why so blue?**
Normal maps, like the one shown above, typically have a lot of blue. Why is this? What is the minimum possible value the blue channel of the RGB encoding assuming the normal is expressed in relation to the tangent plane at a point on the surface?
2. Implementing Normal Mapping in the Shader Program

There's more than one correct way to do this, but...
Describe in words what data are passed to the Vertex Shader?
What data are passed to the Fragment Shader?

3. Deriving the Tangent and Bitangent Vectors

From the images shown above we can derive the following equations
\[ p_1 = u_1 T + v_1 B \quad p_2 = u_2 T + v_2 B \quad p_3 = u_3 T + v_3 B \]
Describe in words: what are the \( P_i \)? What are the \( u_i \) and \( v_i \)?

Without referring to lecture slides, can you derive expressions for the \( T(angent) \) and \( B(itangent) \) vectors for a local frame for a triangle?

Hint 1: what are expressions for \( p_2-p_1 \) and \( p_3-p_1 \)?
Hint 2:
\[ (v_3-v_1)(p_2-p_1) = (v_3-v_1)(u_2-u_1)T + (v_3-v_1)(v_2-v_1)B + (v_2-v_1)(p_3-p_1) \cdot (v_2-v_1)(u_3-u_1)T + (v_2-v_1)(v_3-v_1)B \]
