1

Functions Over Lists

```
# let rec map f list =  
  match list  
  with [] -> []  
       | (h::t) -> (f h) :: (map f t);;  
val map : ('a -> 'b) -> 'a list -> 'b list = <fun>  
# map plus_two fib5;;  
- : int list = [10; 7; 5; 4; 3; 3]  
# map (fun x -> x - 1) fib6;;  
: int list = [12; 7; 4; 2; 1; 0; 0]
```

10/16/12

2

Iterating over lists

```
# let rec fold_left f a list =  
  match list  
  with [] -> a  
       | (x :: xs) -> fold_left f (f a x) xs;;  
val fold_left : ('a -> 'b -> 'a) -> 'a -> 'b list -> 'a =  
  <fun>  
# fold_left  
  (fun () -> print_string)  
  ()  
  ["hi"; "there"];;  
hithere- : unit = ()
```

10/16/12

3

Iterating over lists

```
# let rec fold_right f list b =  
  match list  
  with [] -> b  
       | (x :: xs) -> f x (fold_right f xs b);;  
val fold_right : ('a -> 'b -> 'b) -> 'a list -> 'b -> 'b =  
  <fun>  
# fold_right  
  (fun s -> fun () -> print_string s)  
  ["hi"; "there"]  
  ();;  
therehi- : unit = ()
```

10/16/12

4

Structural Recursion

- Functions on recursive datatypes (eg lists) tend to be recursive
- Recursion over recursive datatypes generally by structural recursion
 - Recursive calls made to components of structure of the same recursive type
 - Base cases of recursive types stop the recursion of the function

10/16/12

5

Structural Recursion : List Example

```
# let rec length list = match list  
  with [ ] -> 0 (* Nil case *)  
       | x :: xs -> 1 + length xs;; (* Cons case *)  
val length : 'a list -> int = <fun>  
# length [5; 4; 3; 2];;  
- : int = 4
```

- Nil case [] is base case
- Cons case recurses on component list xs

10/16/12

6

Forward Recursion

- In Structural Recursion, split input into components and (eventually) recurse
- Forward Recursion form of Structural Recursion
- In forward recursion, first call the function recursively on all recursive components, and then build final result from partial results
- Wait until whole structure has been traversed to start building answer

10/16/12

7

Forward Recursion: Examples

```
# let rec double_up list =  
  match list  
  with [ ] -> [ ]  
       | (x :: xs) -> (x :: x :: double_up xs);;  
val double_up : 'a list -> 'a list = <fun>  
  
# let rec poor_rev list =  
  match list  
  with [] -> []  
       | (x::xs) -> poor_rev xs @ [x];;  
val poor_rev : 'a list -> 'a list = <fun>
```

10/16/12

8

Encoding Recursion with Fold

```
# let rec append list1 list2 = match list1 with  
[ ] -> list2 | x::xs -> x :: append xs list2;;  
val append : 'a list -> 'a list -> 'a list = <fun>  
  
# let append list1 list2 =  
  fold_right (fun x y -> x :: y) list1 list2;;  
val append : 'a list -> 'a list -> 'a list = <fun>  
# append [1;2;3] [4;5;6];;  
- : int list = [1; 2; 3; 4; 5; 6]
```

Base Case

Operation

Recursive Call

10/16/12

9

Mapping Recursion

- One common form of structural recursion applies a function to each element in the structure

```
# let rec doubleList list = match list  
with [ ] -> [ ]  
     | x::xs -> 2 * x :: doubleList xs;;  
val doubleList : int list -> int list = <fun>  
# doubleList [2;3;4];;  
- : int list = [4; 6; 8]
```

10/16/12

10

Mapping Recursion

- Can use the higher-order recursive map function instead of direct recursion

```
# let doubleList list =  
  List.map (fun x -> 2 * x) list;;  
val doubleList : int list -> int list = <fun>  
# doubleList [2;3;4];;  
- : int list = [4; 6; 8]
```

- Same function, but no rec

10/16/12

11

Folding Recursion

- Another common form “folds” an operation over the elements of the structure

```
# let rec multList list = match list  
with [ ] -> 1  
     | x::xs -> x * multList xs;;  
val multList : int list -> int = <fun>  
# multList [2;4;6];;  
- : int = 48
```

- Computes $(2 * (4 * (6 * 1)))$

10/16/12

12

Folding Recursion

- multList folds to the right
- Same as:

```
# let multList list =
  List.fold_right
    (fun x -> fun p -> x * p)
    list 1;;
val multList : int list -> int = <fun>
# multList [2;4;6];;
- : int = 48
```

10/16/12

13

Folding Functions over Lists

How are the following functions similar?

```
# let rec sumlist list = match list with
  [ ] -> 0 | x::xs -> x + sumlist xs;;
val sumlist : int list -> int = <fun>
# sumlist [2;3;4];;
- : int = 9
# let rec prodlist list = match list with
  [ ] -> 1 | x::xs -> x * prodlist xs;;
val prodlist : int list -> int = <fun>
# prodlist [2;3;4];;
- : int = 24
```

10/16/12

14

Folding

```
# let rec fold_left f a list = match list
  with [ ] -> a | (x :: xs) -> fold_left f (f a x) xs;;
val fold_left : ('a -> 'b -> 'a) -> 'a -> 'b list -> 'a =
  <fun>
fold_left f a [x1; x2;...;xn] = f(...(f (f a x1) x2)...)xn
# let rec fold_right f list b = match list
  with [ ] -> b | (x :: xs) -> f x (fold_right f xs b);;
val fold_right : ('a -> 'b -> 'b) -> 'a list -> 'b -> 'b =
  <fun>
fold_right f [x1; x2;...;xn] b = f x1(f x2(...(f xn b)...) )
```

10/16/12

15

Folding - Forward Recursion

```
# let sumlist list = fold_right (+) list 0;;
val sumlist : int list -> int = <fun>
# sumlist [2;3;4];;
- : int = 9
# let prodlist list = fold_right ( * ) list 1;;
val prodlist : int list -> int = <fun>
# prodlist [2;3;4];;
- : int = 24
```

10/16/12

16

An Important Optimization

- When a function call is made, the return address needs to be saved to the stack so we know to where to return when the call is finished
- What if *f* calls *g* and *g* calls *h*, but calling *h* is the last thing *g* does (a *tail call*)?

10/16/12

17

An Important Optimization

- When a function call is made, the return address needs to be saved to the stack so we know to where to return when the call is finished
- What if *f* calls *g* and *g* calls *h*, but calling *h* is the last thing *g* does (a *tail call*)?
- Then *h* can return directly to *f* instead of *g*

10/16/12

18

Tail Recursion

- A recursive program is tail recursive if all recursive calls are tail calls
- Tail recursive programs may be optimized to be implemented as loops, thus removing the function call overhead for the recursive calls
- Tail recursion generally requires extra "accumulator" arguments to pass partial results
 - May require an auxiliary function

10/16/12

19

Example of Tail Recursion

```
# let rec prod l =  
  match l with [] -> 1  
  | (x :: rem) -> x * prod rem;;  
val prod : int list -> int = <fun>  
# let prod list =  
  let rec prod_aux l acc =  
    match l with [] -> acc  
    | (y :: rest) -> prod_aux rest (acc * y)  
  (* Uses associativity of multiplication *)  
  in prod_aux list 1;;  
val prod : int list -> int = <fun>
```

10/16/12

20

Recall

```
# let rec poor_rev list = match list  
  with [] -> []  
  | (x::xs) -> poor_rev xs @ [x];;  
val poor_rev : 'a list -> 'a list = <fun>
```

- What is its running time?

10/16/12

21

Quadratic Time

- Each step of the recursion takes time proportional to input
- Each step of the recursion makes only one recursive call.
- List example:

```
# let rec poor_rev list = match list  
  with [] -> []  
  | (x::xs) -> poor_rev xs @ [x];;  
val poor_rev : 'a list -> 'a list = <fun>
```

10/16/12

22

Tail Recursion - Example

```
# let rec rev_aux list revlist =  
  match list with [ ] -> revlist  
  | x :: xs -> rev_aux xs (x::revlist);;  
val rev_aux : 'a list -> 'a list -> 'a list = <fun>
```

```
# let rev list = rev_aux list [ ];;  
val rev : 'a list -> 'a list = <fun>
```

- What is its running time?

10/16/12

23

Comparison

- `poor_rev [1,2,3] =`
- `(poor_rev [2,3]) @ [1] =`
- `((poor_rev [3]) @ [2]) @ [1] =`
- `((((poor_rev []) @ [3]) @ [2]) @ [1] =`
- `(([] @ [3]) @ [2]) @ [1] =`
- `([3] @ [2]) @ [1] =`
- `(3::([] @ [2])) @ [1] =`
- `[3,2] @ [1] =`
- `3 :: ([2] @ [1]) =`
- `3 :: (2::([] @ [1])) = [3, 2, 1]`

10/16/12

24

Comparison

- `rev [1,2,3] =`
- `rev_aux [1,2,3] [] =`
- `rev_aux [2,3] [1] =`
- `rev_aux [3] [2,1] =`
- `rev_aux [] [3,2,1] = [3,2,1]`

10/16/12

25

Folding - Tail Recursion

- `# let rev list =`
- `fold_left`
- `(fun l -> fun x -> x :: l) //comb op`
- `[] //accumulator cell`
- `list`

10/16/12

26

Encoding Tail Recursion with fold_left

```
# let prod list = let rec prod_aux l acc =
  match l with [] -> acc
  | (y :: rest) -> prod_aux rest (acc * y)
  in prod_aux list 1;;
val prod : int list -> int = <fun>
# let prod list =
  List.fold_left (fun acc y -> acc * y) 1 list;;
val prod : int list -> int = <fun>
# prod [4;5;6];;
- : int = 120
```

Init Acc Value

Recursive Call

Operation

10/16/12

27

Folding

- Can replace recursion by `fold_right` in any forward primitive recursive definition
 - Primitive recursive means it only recurses on immediate subcomponents of recursive data structure
- Can replace recursion by `fold_left` in any tail primitive recursive definition

10/16/12

28

Map from Fold

```
# let map f list =
  fold_right (fun x y -> f x :: y) list [];
val map : ('a -> 'b) -> 'a list -> 'b list =
  <fun>
# map ((+)1) [1;2;3];;
- : int list = [2; 3; 4]
```

- Can you write `fold_right` (or `fold_left`) with just `map`? How, or why not?

10/16/12

29

Higher Order Functions

- A function is *higher-order* if it takes a function as an argument or returns one as a result
- Example:

```
# let compose f g = fun x -> f (g x);;
val compose : ('a -> 'b) -> ('c -> 'a) -> 'c -> 'b = <fun>
```
- The type `('a -> 'b) -> ('c -> 'a) -> 'c -> 'b` is a higher order type because of `('a -> 'b)` and `('c -> 'a)` and `-> 'c -> 'b`

10/16/12

30

Partial Application

```
# (+);;
- : int -> int -> int = <fun>
# (+) 2 3;;
- : int = 5
# let plus_two = (+) 2;;
val plus_two : int -> int = <fun>
# plus_two 7;;
- : int = 9
```

- Partial application also called *sectioning*

10/16/12

31

Lambda Lifting

- You must remember the rules for evaluation when you use partial application

```
# let add_two = (+) (print_string "test\n"; 2);;
test
val add_two : int -> int = <fun>
# let add2 = (* lambda lifted *)
  fun x -> (+) (print_string "test\n"; 2) x;;
val add2 : int -> int = <fun>
```

10/16/12

32

Lambda Lifting

```
# thrice add_two 5;;
- : int = 11
# thrice add2 5;;
test
test
test
- : int = 11
```

- Lambda lifting delayed the evaluation of the argument to (+) until the second argument was supplied

10/16/12

33

Partial Application and "Unknown Types"

- Recall compose plus_two:

```
# let f1 = compose plus_two;;
val f1 : ('a -> int) -> 'a -> int = <fun>
```

- Compare to lambda lifted version:

```
# let f2 = fun g -> compose plus_two g;;
val f2 : ('a -> int) -> 'a -> int = <fun>
```

- What is the difference?

10/16/12

34

Partial Application and "Unknown Types"

- 'a can only be instantiated once for an expression

```
# f1 plus_two;;
- : int -> int = <fun>
# f1 List.length;;
Characters 3-14:
  f1 List.length;;
  ^^^^^^^^^^^^^^
```

This expression has type 'a list -> int but is here used with type int -> int

10/16/12

35

Partial Application and "Unknown Types"

- 'a can be repeatedly instantiated

```
# f2 plus_two;;
- : int -> int = <fun>
# f2 List.length;;
- : 'a list -> int = <fun>
```

10/16/12

36

Continuation Passing Style

- A programming technique for all forms of “non-local” control flow:
 - non-local jumps
 - exceptions
 - general conversion of non-tail calls to tail calls
- Essentially it's a higher-order function version of GOTO

10/16/12

37

Continuations

- Idea: Use functions to represent the control flow of a program
- Method: Each procedure takes a function as an argument to which to pass its result; outer procedure “returns” no result
- Function receiving the result called a continuation
- Continuation acts as “accumulator” for work still to be done

10/16/12

38

Example of Tail Recursion

```
# let rec app fl x =  
  match fl with [] -> x  
  | (f :: rem_fs) -> f (app rem_fs x);;  
val app : ('a -> 'a) list -> 'a -> 'a = <fun>  
# let app fs x =  
  let rec app_aux fl acc=  
    match fl with [] -> acc  
    | (f :: rem_fs) -> app_aux rem_fs  
                        (fun z -> acc (f z));  
  in app_aux fs (fun y -> y) x;;  
val app : ('a -> 'a) list -> 'a -> 'a = <fun>
```

10/16/12

39

Continuation Passing Style

- Writing procedures so that they take a continuation to which to give (pass) the result, and return no result, is called continuation passing style (CPS)

10/16/12

40

Example of Tail Recursion & CSP

```
# let app fs x =  
  let rec app_aux fl acc=  
    match fl with [] -> acc  
    | (f :: rem_fs) -> app_aux rem_fs  
                        (fun z -> acc (f z));  
  in app_aux fs (fun y -> y) x;;  
val app : ('a -> 'a) list -> 'a -> 'a = <fun>  
# let rec appk fl x k =  
  match fl with [] -> k x  
  | (f :: rem_fs) -> appk rem_fs x (fun z -> k (f z));;  
val appk : ('a -> 'a) list -> 'a -> ('a -> 'b) -> 'b
```

10/16/12

41

Continuation Passing Style

- A compilation technique to implement non-local control flow, especially useful in interpreters.
- A formalization of non-local control flow in denotational semantics

10/16/12

42

Terms

- A function is in Direct Style when it returns its result back to the caller.
- A Tail Call occurs when a function returns the result of another function call without any more computations (eg tail recursion)
- A function is in Continuation Passing Style when it passes its result to another function.
- Instead of returning the result to the caller, we pass it forward to another function.

10/16/12

43

Example

- Simple reporting continuation:

```
# let report x = (print_int x; print_newline( ) );;  
val report : int -> unit = <fun>
```

- Simple function using a continuation:

```
# let plusk a b k = k (a + b)  
val plusk : int -> int -> (int -> 'a) -> 'a = <fun>  
# plusk 20 22 report;;  
42  
- : unit = ()
```

10/16/12

44

Simple Functions Taking Continuations

- Given a primitive operation, can convert it to pass its result forward to a continuation
- Examples:
let subk x y k = k(x + y);;
val subk : int -> int -> (int -> 'a) -> 'a = <fun>
let eqk x y k = k(x = y);;
val eqk : 'a -> 'a -> (bool -> 'b) -> 'b = <fun>
let timesk x y k = k(x * y);;
val timesk : int -> int -> (int -> 'a) -> 'a = <fun>

10/16/12

45

Nesting Continuations

```
# let add_three x y z = x + y + z;;  
val add_three : int -> int -> int -> int = <fun>  
# let add_three x y z = let p = x + y in p + z;;  
val add_three : int -> int -> int -> int = <fun>  
# let add_three_k x y z k =  
  addk x y (fun p -> addk p z k);;  
val add_three_k : int -> int -> int -> (int -> 'a)  
  -> 'a = <fun>
```

10/16/12

46
