Programming Languages and Compilers (CS 421)

Elsa L Gunter 2112 SC, UIUC

http://courses.engr.illinois.edu/cs421

Based in part on slides by Mattox Beckman, as updated by Vikram Adve and Gul Agha

11/8/12

Semantics

- Expresses the meaning of syntax
- Static semantics
 - Meaning based only on the form of the expression without executing it
 - Usually restricted to type checking / type inference

11/8/12 2

Dynamic semantics

- Method of describing meaning of executing a program
- Several different types:
 - Operational Semantics
 - Axiomatic Semantics
 - Denotational Semantics

11/8/12

Dynamic Semantics

- Different languages better suited to different types of semantics
- Different types of semantics serve different purposes

11/8/12 4

Operational Semantics

- Start with a simple notion of machine
- Describe how to execute (implement)
 programs of language on virtual machine, by
 describing how to execute each program
 statement (ie, following the structure of the
 program)
- Meaning of program is how its execution changes the state of the machine
- Useful as basis for implementations

11/8/12

5

Axiomatic Semantics

- Also called Floyd-Hoare Logic
- Based on formal logic (first order predicate calculus)
- Axiomatic Semantics is a logical system built from axioms and inference rules
- Mainly suited to simple imperative programming languages

Axiomatic Semantics

- Used to formally prove a property (post-condition) of the state (the values of the program variables) after the execution of program, assuming another property (pre-condition) of the state before execution
- Written: {Precondition} Program {Postcondition}
- Source of idea of loop invariant

11/8/12

Denotational Semantics

- Construct a function M assigning a mathematical meaning to each program construct
- Lambda calculus often used as the range of the meaning function
- Meaning function is compositional: meaning of construct built from meaning of parts
- Useful for proving properties of programs

11/8/12 8

Natural Semantics

- Aka Structural Operational Semantics, aka "Big Step Semantics"
- Provide value for a program by rules and derivations, similar to type derivations
- Rule conclusions look like

11/8/12

Simple Imperative Programming Language

- *I* ∈ *Identifiers*
- N ∈ Numerals
- B ::= true | false | B & B | B or B | not B
 | E < E | E = E
- E::= N | I | E + E | E * E | E E | E
- *C*::= skip | *C*; *C* | *I* ::= *E* | if *B* then *C* else *C* fi | while *B* do *C* od

11/8/12 10

Natural Semantics of Atomic Expressions

• Identifiers: $(I,m) \Downarrow m(I)$

■ Numerals are values: $(N,m) \Downarrow N$

■ Booleans: $(\text{true}, m) \Downarrow \text{true}$ $(\text{false}, m) \Downarrow \text{false}$

(laise ,ill) # laise

Booleans:

12

11/8/12

Relations

$$\underbrace{(E, m) \Downarrow U \quad (E', m) \Downarrow V \quad U \sim V = b}_{(E \sim E', m) \Downarrow b}$$

- By U ~ V = b, we mean does (the meaning of) the relation ~ hold on the meaning of U and V
- May be specified by a mathematical expression/equation or rules matching U and V

11/8/12 13

Arithmetic Expressions

$$(E, m) \Downarrow U \quad (E', m) \Downarrow V \quad U \text{ op } V = N$$
$$(E \text{ op } E', m) \Downarrow N$$

where N is the specified value for U op V

11/8/12 14

Commands

Skip: $(skip, m) \downarrow m$

Assignment: $(E,m) \Downarrow V$ $(I::=E,m) \Downarrow m \lceil I < --V \rceil$

Sequencing: $(C,m) \Downarrow m' (C',m') \Downarrow m''$ $(C,C',m) \Downarrow m''$

11/8/12 15

If Then Else Command

 $(B,m) \Downarrow \text{true } (C,m) \Downarrow m'$ (if B then C else C'fi, m) $\Downarrow m'$

 $\underbrace{(B,m) \Downarrow \text{ false } (C',m) \Downarrow m'}_{\text{(if } B \text{ then } C \text{ else } C' \text{fi, } m) \Downarrow m'}$

11/8/12 16

While Command

$$(B,m) \Downarrow false$$
(while B do C od, m) \ \ \ m

 $\frac{(B,m) \Downarrow \text{true } (C,m) \Downarrow m' \text{ (while } B \text{ do } C \text{ od, } m') \Downarrow m''}{\text{(while } B \text{ do } C \text{ od, } m) \Downarrow m''}$

17

Example: If Then Else Rule

(if x > 5 then y:= 2 + 3 else y:=3 + 4 fi, $\{x -> 7\}$) \downarrow ?

11/8/12

18

11/8/12

Example: If Then Else Rule

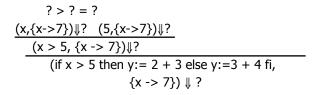

Example: Arith Relation

$$(x > 5, \{x \to 7\}) \downarrow ?$$

(if $x > 5$ then $y := 2 + 3$ else $y := 3 + 4$ fi,
 $\{x \to 7\}\} \downarrow ?$

11/8/12 19

11/8/12 20

Example: Identifier(s)

7 > 5 = true $(x,\{x->7\}) \downarrow 7 \quad (5,\{x->7\}) \downarrow 5$ $(x > 5, \{x -> 7\}) \downarrow ?$ (if x > 5 then y := 2 + 3 else y := 3 + 4 fi, $\{x -> 7\}) \downarrow ?$

11/8/12 21

Example: Arith Relation

7 > 5 = true $\frac{(x,\{x->7\}) \downarrow 7 \quad (5,\{x->7\}) \downarrow 5}{(x > 5, \{x -> 7\}) \downarrow \text{true}}$ $\frac{(\text{if } x > 5 \text{ then } y := 2 + 3 \text{ else } y := 3 + 4 \text{ fi,}}{(x -> 7\}) \downarrow ?}$

11/8/12 22

Example: If Then Else Rule

11/8/12 23

Example: Assignment

Example: Arith Op

$$? + ? = ?$$

$$(2,\{x->7\}) \Downarrow? \quad (3,\{x->7\}) \Downarrow?$$

$$7 > 5 = \text{true} \qquad (2+3,\{x->7\}) \Downarrow?$$

$$(x,\{x->7\}) \Downarrow7 \quad (5,\{x->7\}) \Downarrow5 \qquad (y:= 2+3,\{x->7\})$$

$$(x > 5, \{x -> 7\}) \Downarrow \text{true} \qquad \Downarrow? \qquad .$$

$$(\text{if } x > 5 \text{ then } y:= 2+3 \text{ else } y:= 3+4 \text{ fi},$$

$$\{x -> 7\}) \Downarrow?$$

11/8/12 25

Example: Numerals

$$2 + 3 = 5$$

$$(2,\{x->7\}) \downarrow 2 \quad (3,\{x->7\}) \downarrow 3$$

$$7 > 5 = \text{true} \qquad (2+3,\{x->7\}) \downarrow ?$$

$$(x,\{x->7\}) \downarrow 7 \quad (5,\{x->7\}) \downarrow 5 \qquad (y:= 2+3,\{x->7\})$$

$$(x > 5, \{x -> 7\}) \downarrow \text{true} \qquad \downarrow ?$$

$$(if x > 5 \text{ then } y:= 2+3 \text{ else } y:= 3+4 \text{ fi},$$

$$\{x -> 7\}) \downarrow ?$$

11/8/12 26

Example: Arith Op

$$2 + 3 = 5$$

$$(2,\{x->7\}) \downarrow 2 \quad (3,\{x->7\}) \downarrow 3$$

$$7 > 5 = \text{true} \qquad (2+3,\{x->7\}) \downarrow 5$$

$$(x,\{x->7\}) \downarrow 7 \quad (5,\{x->7\}) \downarrow 5 \qquad (y:= 2 + 3, \{x-> 7\})$$

$$(x > 5, \{x -> 7\}) \downarrow \text{true} \qquad \qquad \downarrow?$$

$$(if x > 5 \text{ then } y:= 2 + 3 \text{ else } y:= 3 + 4 \text{ fi},$$

$$\{x -> 7\}) \downarrow ?$$

11/8/12 27

Example: Assignment

$$2 + 3 = 5$$

$$(2,{x->7}) \downarrow 2 \quad (3,{x->7}) \downarrow 3$$

$$7 > 5 = \text{true} \qquad (2+3, {x->7}) \downarrow 5$$

$$(x,{x->7}) \downarrow 7 \quad (5,{x->7}) \downarrow 5 \qquad (y:= 2 + 3, {x-> 7})$$

$$(x > 5, {x -> 7}) \downarrow \text{true} \qquad \downarrow {x->7, y->5}$$

$$(if x > 5 \text{ then } y:= 2 + 3 \text{ else } y:= 3 + 4 \text{ fi,}$$

$$\{x -> 7\}) \downarrow ?$$

11/8/12 28

Example: If Then Else Rule

$$2 + 3 = 5$$

$$(2,\{x->7\}) \downarrow 2 \quad (3,\{x->7\}) \downarrow 3$$

$$7 > 5 = \text{true} \qquad (2+3,\{x->7\}) \downarrow 5$$

$$(x,\{x->7\}) \downarrow 7 \quad (5,\{x->7\}) \downarrow 5 \qquad (y:= 2+3,\{x->7\})$$

$$(x > 5, \{x -> 7\}) \downarrow \text{true} \qquad \downarrow \{x->7, y->5\}$$

$$(if x > 5 \text{ then } y:= 2+3 \text{ else } y:= 3+4 \text{ fi},$$

$$\{x -> 7\}) \downarrow \{x->7, y->5\}$$

11/8/12 29

Let in Command

$$\frac{(E,m) \Downarrow v \ (C,m[I < -v]) \Downarrow m'}{(\text{let } I = E \text{ in } C, m) \Downarrow m''}$$

Where m''(y) = m'(y) for $y \ne I$ and m''(I) = m(I) if m(I) is defined, and m''(I) is undefined otherwise

$$\frac{(x,\{x->5\}) \downarrow 5 \quad (3,\{x->5\}) \downarrow 3}{(x+3,\{x->5\}) \downarrow 8}$$
$$\frac{(5,\{x->17\}) \downarrow 5 \quad (x:=x+3,\{x->5\}) \downarrow \{x->8\}}{(\text{let } x=5 \text{ in } (x:=x+3), \{x->17\}) \downarrow ?}$$

11/8/12 31

$$\frac{(x,\{x->5\}) \downarrow 5 \quad (3,\{x->5\}) \downarrow 3}{(x+3,\{x->5\}) \downarrow 8}$$
$$\frac{(5,\{x->17\}) \downarrow 5 \quad (x:=x+3,\{x->5\}) \downarrow \{x->8\}}{(\text{let } x=5 \text{ in } (x:=x+3), \{x->17\}) \downarrow \{x->17\}}$$

11/8/12 32

Comment

- Simple Imperative Programming Language introduces variables implicitly through assignment
- The let-in command introduces scoped variables explictly
- Clash of constructs apparent in awkward semantics

11/8/12 33

Interpretation Versus Compilation

- A compiler from language L1 to language L2 is a program that takes an L1 program and for each piece of code in L1 generates a piece of code in L2 of same meaning
- An interpreter of L1 in L2 is an L2 program that executes the meaning of a given L1 program
- Compiler would examine the body of a loop once; an interpreter would examine it every time the loop was executed

11/8/12 34

Interpreter

- An Interpreter represents the operational semantics of a language L1 (source language) in the language of implementation L2 (target language)
- Built incrementally
 - Start with literals
 - Variables
 - Primitive operations
 - Evaluation of expressions
 - Evaluation of commands/declarations

11/8/12 35

Interpreter

- Takes abstract syntax trees as input
 - In simple cases could be just strings
- One procedure for each syntactic category (nonterminal)
 - eg one for expressions, another for commands
- If Natural semantics used, tells how to compute final value from code
- If Transition semantics used, tells how to compute next "state"
 - To get final value, put in a loop

Natural Semantics Example

- compute_exp (Var(v), m) = look_up v m
- compute_exp (Int(n), _) = Num (n)

11/8/12

compute_com(IfExp(b,c1,c2),m) =
 if compute_exp (b,m) = Bool(true)
 then compute_com (c1,m)
 else compute_com (c2,m)

37

Natural Semantics Example

- compute_com(While(b,c), m) =
 if compute_exp (b,m) = Bool(false)
 then m
 else compute_com
 (While(b,c), compute_com(c,m))
- May fail to terminate exceed stack limits
- Returns no useful information then
