

Programming Languages and Compilers (CS 421)

Sasa Misailovic
4110 SC, UIUC

<https://courses.engr.illinois.edu/cs421/fa2017/CS421A>

Based in part on slides by Mattox Beckman, as updated
by Vikram Adve, Gul Agha, and Elsa L Gunter

Recall

```
# let rec poor_rev list = match list with  
    [] -> []  
    | (x::xs) -> poor_rev xs @ [x];;  
val poor_rev : 'a list -> 'a list = <fun>
```

- What is its running time?

Comparison

- `poor_rev [1,2,3] =`
- `(poor_rev [2,3]) @ [1] =`
- `((poor_rev [3]) @ [2]) @ [1] =`
- `((poor_rev []) @ [3]) @ [2]) @ [1] =`
- `(([] @ [3]) @ [2]) @ [1] =`
- `([3] @ [2]) @ [1] =`
- `(3:: ([] @ [2])) @ [1] =`
- `[3,2] @ [1] =`
- `3 :: ([2] @ [1]) =`
- `3 :: (2:: ([] @ [1])) = [3, 2, 1]`

Tail Recursion - Example

```
# let rec rev_aux list revlist =  
  match list with  
  [ ] -> revlist  
  | x :: xs -> rev_aux xs (x::revlist);;  
val rev_aux : 'a list -> 'a list -> 'a list =  
  <fun>
```

```
# let rev list = rev_aux list [ ];;  
val rev : 'a list -> 'a list = <fun>
```

- What is its running time?

Comparison

- $\text{rev } [1,2,3] =$
- $\text{rev_aux } [1,2,3] [] =$
- $\text{rev_aux } [2,3] [1] =$
- $\text{rev_aux } [3] [2,1] =$
- $\text{rev_aux } [] [3,2,1] = [3,2,1]$

Your turn now

Write a function

```
map_tail : ('a -> 'b) -> 'a list -> 'b list
```

that takes a function and a list of inputs and gives the result of applying the function on each argument, but in tail recursive form.

```
let map_tail f lst =
```

Folding - Tail Recursion

```
# let rec rev_aux list revlist =  
  match list with  
    [ ] -> revlist  
  | x :: xs -> rev_aux xs (x::revlist);;  
# let rev list = rev_aux list [ ];;  
  
# let rev list =  
  fold_left  
    (fun l -> fun x -> x :: l) (* comb op *)  
    [] (* accumulator cell *)  
    list
```

Folding

- Can replace recursion by **fold_right** in any **forward primitive** recursive definition
 - Primitive recursive means it only recurses on immediate subcomponents of recursive data structure
- Can replace recursion by **fold_left** in any **tail primitive** recursive definition

Example of Tail Recursion

```
# let rec app f1 x =  
  match f1 with [] -> x  
  | (f :: rem_fs) -> f (app rem_fs x);;  
val app : ('a -> 'a) list -> 'a -> 'a = <fun>
```

```
# let app fs x =  
  let rec app_aux f1 acc =  
    match f1 with [] -> acc  
    | (f :: rem_fs) -> app_aux rem_fs  
      (fun z -> acc (f z))  
  in app_aux fs (fun y -> y) x;  
val app : ('a -> 'a) list -> 'a -> 'a = <fun>
```

Continuations

- A programming technique for all forms of “non-local” control flow:
 - non-local jumps
 - exceptions
 - general conversion of non-tail calls to tail calls
- Essentially it's a higher-order function version of GOTO

Continuations

- **Idea:** Use functions to represent the control flow of a program
- **Method:** Each procedure takes a function as an extra argument to which to pass its result; outer procedure “returns” no result
- Function receiving the result called a **continuation**
- Continuation acts as “accumulator” for work still to be done

Simplest CPS Example

Identity function:

- `let ident x = x`

Identity function in CPS:

- `let identk x ret = ret x`

Example

- Simple function using a continuation:

```
# let addk (a, b) k = k (a + b);;
```

```
val addk : int * int -> (int -> 'a) -> 'a = <fun>
```

```
# addk (22, 20) report;;
```

```
42
```

```
- : unit = ()
```

- Simple reporting continuation:

```
# let report x = (print_int x; print_newline();  
                 exit 0);;
```

```
val report : int -> unit = <fun>
```

Continuation Passing Style

- Writing procedures such that all procedure calls take a continuation to which to give (pass) the result, and return no result, is called continuation passing style (CPS)

Continuation Passing Style

- A compilation technique to implement non-local control flow, especially useful in interpreters.
- A formalization of non-local control flow in denotational semantics
- Possible intermediate state in compiling functional code

Why CPS?

- Makes order of evaluation explicitly clear
- Allocates variables (to become registers) for each step of computation
- Essentially converts functional programs into imperative ones
 - Major step for compiling to assembly or byte code
- Tail recursion easily identified
- Strict forward recursion converted to tail recursion
 - At the expense of building large closures in heap

Other Uses for Continuations

- CPS designed to preserve order of evaluation
 - Continuations used to express order of evaluation
- Can be used to change order of evaluation
- Implements:
 - Exceptions and exception handling
 - Co-routines
 - (pseudo, aka green) threads

Example

- Simple reporting continuation:

```
# let report x = (print_int x; print_newline();  
                 exit 0);;  
val report : int -> unit = <fun>
```

- Simple function using a continuation:

```
# let addk (a, b) k = k (a + b);;
```

```
val addk : int * int -> (int -> 'a) -> 'a = <fun>
```

```
# addk (22, 20) report;;
```

```
42
```

```
- : unit = ()
```

Simple Functions Taking Continuations

- Given a primitive operation, can convert it to pass its result forward to a continuation
- Examples:

```
# let subk (x, y) k = k (x - y);;
```

```
val subk : int * int -> (int -> 'a) -> 'a = <fun>
```

```
# let eqk (x, y) k = k (x = y);;
```

```
val eqk : 'a * 'a -> (bool -> 'b) -> 'b = <fun>
```

```
# let timesk (x, y) k = k (x * y);;
```

```
val timesk : int * int -> (int -> 'a) -> 'a = <fun>
```

Nesting Continuations

```
# let add_triple (x, y, z) = (x + y) + z;;  
val add_triple : int * int * int -> int = <fun>
```

```
# let add_triple (x,y,z) = let p = x + y in p + z;;  
val add_three : int -> int -> int -> int = <fun>
```

```
# let add_triple_k (x, y, z) k =  
    addk (x, y) (fun p -> addk (p, z) k );;  
val add_triple_k: int * int * int -> (int -> 'a) ->  
    'a = <fun>
```

add_three: a different order

```
# let add_triple_k (x, y, z) k =  
  addk (x, y) (fun p -> addk (p, z) k );;
```

- How do we write `add_triple_k` to use a different order?

- `# let add_triple (x, y, z) = x + (y + z);;`

- `let add_triple_k (x, y, z) k =`

Terms

- A function is in **Direct Style** when it returns its result back to the caller.
- A **Tail Call** occurs when a function returns the result of another function call without any more computations (eg tail recursion)
- A function is in **Continuation Passing Style** when it, and every function call in it, passes its result to another function.
- Instead of returning the result to the caller, we pass it forward to another function.

Terminology

- Tail Position: A subexpression s of expressions e , such that if evaluated, will be taken as the value of e
 - if $(x > 3)$ then $x + 2$ else $x - 4$
 - let $x = 5$ in $x + 4$
- Tail Call: A function call that occurs in tail position
 - if $(h\ x)$ then $f\ x$ else $(x + g\ x)$

Recursive Functions

■ Recall:

```
# let rec factorial n =  
    if n = 0 then 1 else n * factorial (n - 1);;  
val factorial : int -> int = <fun>  
  
# factorial 5;;  
- : int = 120
```

Recursive Functions

```
# let rec factorial n =  
    if n = 0 then 1 else n * factorial (n - 1);;  
  
# let rec factorial n =  
    let b = (n = 0) in      (* 1st computation *)  
    if b then 1             (* Returned value *)  
    else let s = n - 1 in  (* 2nd computation *)  
        let r = factorial s in  (* 3rd computation *)  
        n * r (* Returned value *) ;;  
  
val factorial : int -> int = <fun>  
  
# factorial 5;;  
- : int = 120
```

Recursive Functions

```
# let rec factorialk n k =  
  eqk (n, 0)  
  (fun b -> (* 1st computation *)  
    if b then  
      k 1 (* Passed val *)  
    else  
      subk (n,1) (* 2nd computation *)  
        (fun s -> factorialk s (* 3rd computation*)  
          (fun r -> timesk (n, r) k) (* Passed val*))  
        )  
  )  
)
```

```
val factorialk : int -> int = <fun>
```

```
# factorialk 5 report;;
```

```
120
```

Recursive Functions

- To make recursive call, must build intermediate continuation to
 - take recursive value: r
 - build it to final result: $n * r$
 - And pass it to final continuation:
 - $\text{times}(n, r) k = k(n * r)$

Example: CPS for length

```
let rec length list = match list with  
  [] -> 0  
  | (a :: bs) -> 1 + length bs
```

What is the let-expanded version of this?

Example: CPS for length

```
let rec length list = match list with  
  [] -> 0  
  | (a :: bs) -> 1 + length bs
```

What is the let-expanded version of this?

```
let rec length list = match list with  
  [] -> 0  
  | (a :: bs) -> let r1 = length bs in  
                  1 + r1
```

Example: CPS for length

```
let rec length list = match list with  
    [] -> 0  
  | (a :: bs) -> 1 + length bs
```

What is the CPS version of this?

Example: CPS for length

```
let rec length list = match list with
  [] -> 0
  | (a :: bs) -> 1 + length bs
```

What is the CPS version of this?

```
#let rec lengthk list k = match list with
  [] -> k 0
  | x :: xs -> lengthk xs
                    (fun r -> addk (r,1) k);;
```

```
# lengthk [2;4;6;8] report;;
```

4

Order of Evaluation Matters!

- Your turn (MP2): Write a function `quaddk` that takes three integer arguments, `a`, `b`, and `c`, and “returns” the result of the expression $(2*(a*b) + 5*b) + c$
- `# let quaddk (a, b, c) k = ... ;;`

- Is the CPS form the same as for $2*a*b + 5*b + c$?
 - Refresher: Eval/App slides & Madhu’s notes posted on Piazza
 - **MP2 solutions implement the order of evaluation of arithmetic operators from right to left**

CPS for Higher Order Functions

- In CPS, every procedure / function takes a continuation to receive its result
- Procedures passed as arguments take continuations
- Procedures returned as results take continuations
- CPS version of higher-order functions must expect input procedures to take continuations

Example: all

```
#let rec all (p, l) = match l with [] -> true
  | (x :: xs) -> let b = p x in
    if b then all (p, xs) else false
val all : ('a -> bool) -> 'a list -> bool = <fun>
```

- What is the CPS version of this?

Example: all

```
#let rec all (p, l) = match l with [] -> true  
  | (x :: xs) -> let b = p x in  
    if b then all (p, xs) else false
```

- What is the CPS version of this?

```
#let rec allk (pk, l) k =
```

Example: all

```
#let rec all (p, l) = match l with [] -> true
  | (x :: xs) -> let b = p x in
    if b then all (p, xs) else false
```

- What is the CPS version of this?

```
#let rec allk (pk, l) k = match l with
  [] ->      true
```

Example: all

```
#let rec all (p, l) = match l with [] -> true
  | (x :: xs) -> let b = p x in
    if b then all (p, xs) else false
```

- What is the CPS version of this?

```
#let rec allk (pk, l) k = match l with
  [] -> k true
```

Example: all

```
#let rec all (p, l) = match l with [] -> true
  | (x :: xs) -> let b = p x in
    if b then all (p, xs) else false
```

- What is the CPS version of this?

```
#let rec allk (pk, l) k = match l with
  [] -> k true
  | (x :: xs) ->
```

Example: all

```
#let rec all (p, l) = match l with [] -> true
  | (x :: xs) -> let b = p x in
    if b then all (p, xs) else false
```

- What is the CPS version of this?

```
#let rec allk (pk, l) k = match l with
  [] -> k true
  | (x :: xs) ->
    pk x
```

Example: all

```
#let rec all (p, l) = match l with [] -> true
  | (x :: xs) -> let b = p x in
    if b then all (p, xs) else false
```

- What is the CPS version of this?

```
#let rec allk (pk, l) k = match l with
  [] -> k true
  | (x :: xs) ->
    pk x (fun b -> if b then
                  else
                    )
```

Example: all

```
#let rec all (p, l) = match l with [] -> true
  | (x :: xs) -> let b = p x in
    if b then all (p, xs) else false
```

- What is the CPS version of this?

```
#let rec allk (pk, l) k = match l with
  [] -> k true
  | (x :: xs) ->
    pk x (fun b -> if b then allk (pk, xs) k
                      else )
```

Example: all

```
#let rec all (p, l) = match l with [] -> true
  | (x :: xs) -> let b = p x in
    if b then all (p, xs) else false
```

- What is the CPS version of this?

```
#let rec allk (pk, l) k = match l with
  [] -> k true
  | (x :: xs) ->
    pk x (fun b -> if b then allk (pk, xs) k
      else k false )
```

```
val allk : ('a -> (bool -> 'b) -> 'b) * 'a list ->
  (bool -> 'b) -> 'b = <fun>
```

Terms

- A function is in **Direct Style** when it returns its result back to the caller.
- A **Tail Call** occurs when a function returns the result of another function call without any more computations (eg tail recursion)
- A function is in **Continuation Passing Style** when it, and every function call in it, passes its result to another function.
- Instead of returning the result to the caller, we pass it forward to another function.

Terminology

- Tail Position: A subexpression s of expressions e , such that if evaluated, will be taken as the value of e
 - if $(x > 3)$ then $x + 2$ else $x - 4$
 - let $x = 5$ in $x + 4$
- Tail Call: A function call that occurs in tail position
 - if $(h\ x)$ then $f\ x$ else $(x + g\ x)$

Terminology

- **Available:** A function call that can be executed by the current expression
- The fastest way to be unavailable is to be guarded by an abstraction (anonymous function, lambda lifted).

- if (h x) then f x else (x + g x)
- if (h x) then (fun x -> f x) else (g (x + x))

Not available

CPS Transformation

- Step 1: Add continuation argument to any function definition:
 - $\text{let } f \text{ arg} = e \Rightarrow \text{let } f \text{ arg } k = e$
 - Idea: Every function takes an extra parameter saying where the result goes
- Step 2: A simple expression in tail position should be passed to a continuation instead of returned:
 - $\text{return } a \Rightarrow k \ a$
 - Assuming a is a constant or variable.
 - “Simple” = “No available function calls.”

CPS Transformation

- Step 3: Pass the current continuation to every function call in tail position
 - $\text{return } f \text{ arg} \Rightarrow f \text{ arg } k$
 - The function “isn’ t going to return,” so we need to tell it where to put the result.

CPS Transformation

- Step 4: Each function call not in tail position needs to be converted to take a new continuation (containing the old continuation as appropriate)
 - $\text{return op (f arg)} \Rightarrow \text{f arg (fun r -> k(op r))}$
 - op represents a primitive operation
 - $\text{return f(g arg)} \Rightarrow \text{g arg (fun r-> f r k)}$

Example

Step 1: Add continuation argument to any function definition

Step 2: A simple expression in tail position should be passed to a continuation instead of returned

Step 3: Pass the current continuation to every function call in tail position

Step 4: Each function call not in tail position needs to be converted to take a new continuation (containing the old continuation as appropriate)

Before:

```
let rec add_list lst =  
  
  match lst with  
  | [] -> 0  
  | 0 :: xs -> add_list xs  
  | x :: xs -> (+) x  
    (add_list xs);;
```

After:

```
let rec add_listk lst k =  
    (* rule 1 *)  
  
  match lst with  
  | [] -> k 0      (* rule 2 *)  
  | 0 :: xs -> add_listk xs k  
    (* rule 3 *)  
  | x :: xs -> add_listk xs  
    (fun r -> k ((+) x r));;  
    (* rule 4 *)
```

CPS for sum

```
# let rec sum list = match list with
  [ ] -> 0
  | x :: xs -> x + sum xs ;;
val sum : int list -> int = <fun>
```

CPS for sum

```
# let rec sum list = match list with
  [ ] -> 0
  | x :: xs -> x + sum xs ;;
```

```
# let rec sum list = match list with
  [ ] -> 0
  | x :: xs -> let r1 = sum xs in x + r1;;
```

CPS for sum

```
# let rec sum list = match list with  
  [ ] -> 0  
  | x :: xs -> x + sum xs ;;
```

```
# let rec sum list = match list with  
  [ ] -> 0  
  | x :: xs -> let r1 = sum xs in x + r1;;
```

```
# let rec sumk list k = match list with  
  [ ] -> k 0  
  | x :: xs -> sumk xs (fun r1 -> addk x r1 k);;
```

CPS for sum

```
# let rec sum list = match list with
  [ ] -> 0
  | x :: xs -> x + sum xs ;;
```

```
# let rec sum list = match list with
  [ ] -> 0
  | x :: xs -> let r1 = sum xs in x + r1;;
```

```
# let rec sumk list k = match list with
  [ ] -> k 0
  | x :: xs -> sumk xs (fun r1 -> addk x r1 k);;
```

```
# sumk [2;4;6;8] report;;
```

Other Uses for Continuations

- CPS designed to **preserve evaluation order**
- **Continuations** used to **express** order of evaluation

- Can also be used to **change** order of evaluation
- Implements:
 - Exceptions and exception handling
 - Co-routines
 - (pseudo, aka green) threads

Exceptions - Example

```
# exception Zero;;  
exception Zero  
  
# let rec list_mult_aux list =  
  match list with  
  | [] -> 1  
  | x :: xs ->  
    if x = 0 then raise Zero  
    else x * list_mult_aux xs;;  
val list_mult_aux : int list -> int = <fun>
```

Exceptions - Example

```
# let list_mult list =  
    try list_mult_aux list with Zero -> 0;;  
val list_mult : int list -> int = <fun>
```

```
# list_mult [3;4;2];;  
- : int = 24
```

```
# list_mult [7;4;0];;  
- : int = 0
```

```
# list_mult_aux [7;4;0];;  
Exception: Zero.
```

Exceptions

- When an exception is raised
 - The current computation is aborted
 - Control is “thrown” back up the call stack until a matching handler is found
 - All the intermediate calls waiting for a return values are thrown away

Implementing Exceptions

```
# let multkp (m, n) k =  
  let r = m * n in  
    ( print_string "product result: ";  
      print_int r; print_string "\n";  
      k r);;  
val multkp : int ( int -> (int -> 'a) -> 'a =  
  <fun>
```

Implementing Exceptions

```
# let rec list_multk_aux list k kexcp =  
  match list with  
    [ ] -> k 1  
  | x :: xs -> if x = 0 then kexcp 0  
               else  
                 list_multk_aux xs  
                   (fun r -> multkp (x, r) k)  
                   kexcp;;  
  
# let rec list_multk list k =  
  list_multk_aux list k  
  (fun x -> print_string "nil\n");;
```

Implementing Exceptions

```
# list_multk [3;4;2] report;;
```

```
product result: 2
```

```
product result: 8
```

```
product result: 24
```

```
24
```

```
- : unit = ()
```

```
# list_multk [7;4;0] report;;
```

```
nil
```

```
- : unit = ()
```
