Programming Languages and Compilers (CS 421)

Elsa L Gunter 2112 SC, UIUC

http://courses.engr.illinois.edu/cs421

Based in part on slides by Mattox Beckman, as updated by Vikram Adve and Gul Agha

3/21/24

Unification Problem

Given a set of pairs of terms ("equations")

$$\{(s_1, t_1), (s_2, t_2), ..., (s_n, t_n)\}$$

(the *unification problem*) does there exist a substitution σ (the *unification solution*) of terms for variables such that

$$\sigma(s_i) = \sigma(t_i),$$

for all i = 1, ..., n?

3/21/24 2

Uses for Unification

- Type Inference and type checking
- Pattern matching as in OCaml
 - Can use a simplified version of algorithm
- Logic Programming Prolog
- Simple parsing

3/21/24

4

Unification Algorithm

- Let $S = \{(s_1 = t_1), (s_2 = t_2), ..., (s_n = t_n)\}$ be a unification problem.
- Case S = { }: Unif(S) = Identity function
 (i.e., no substitution)
- Case $S = \{(s, t)\} \cup S'$: Four main steps

3/21/24 4

Unification Algorithm

- Delete: if s = t (they are the same term) then Unif(S) = Unif(S')
- Decompose: if $s = f(q_1, ..., q_m)$ and $t = f(r_1, ..., r_m)$ (same f, same m!), then Unif(S) = Unif($\{(q_1, r_1), ..., (q_m, r_m)\} \cup S'$)
- Orient: if t = x is a variable, and s is not a variable, Unif(S) = Unif ({(x = s)} ∪ S')

3/21/24

4

Unification Algorithm

- Eliminate: if s = x is a variable, and x does not occur in t (the occurs check), then
 - Let $\varphi = \{x \rightarrow t\}$
 - Unif(S) = Unif(φ (S')) o {x \rightarrow t}
 - Let $\psi = \text{Unif}(\phi(S'))$
 - Unif(S) = $\{x \rightarrow \psi(t)\}\ o \ \psi$
 - Note: {x → a} o {y → b} =
 {y → ({x → a}(b))} o {x → a} if y not
 in a

3/21/24 III d

Tricks for Efficient Unification

- Don't return substitution, rather do it incrementally
- Make substitution be constant time
 - Requires implementation of terms to use mutable structures (or possibly lazy structures)
 - We won't discuss these

3/21/24

Example

- x,y,z variables, f,g constructors
- Unify $\{(f(x) = f(g(f(z),y))), (g(y,y) = x)\} = ?$

3/21/24 8

Example

- x,y,z variables, f,g constructors
- S = {(f(x) = f(g(f(z),y))), (g(y,y) = x)} is nonempty
- Unify $\{(f(x) = f(g(f(z),y))), (g(y,y) = x)\} = ?$

3/21/24

Example

- x,y,z variables, f,g constructors
- Pick a pair: (g(y,y) = x)
- Unify $\{(f(x) = f(g(f(z),y))), (g(y,y) = x)\} = ?$

3/21/24 10

Example

- x,y,z variables, f,g constructors
- Pick a pair: (g(y,y)) = x
- Orient: (x = g(y,y))
- Unify {(f(x) = f(g(f(z),y))), (g(y,y) = x)} = Unify {(f(x) = f(g(f(z),y))), (x = g(y,y))} by Orient

3/21/24

11

Example

- x,y,z variables, f,g constructors
- Unify $\{(f(x) = f(g(f(z),y))), (x = g(y,y))\} = ?$

Example

- x,y,z variables, f,g constructors
- {(f(x) = f(g(f(z),y))), (x = g(y,y))} is nonempty
- Unify $\{(f(x) = f(g(f(z),y))), (x = g(y,y))\} = ?$

3/21/24

Example

- x,y,z variables, f,g constructors
- Pick a pair: (x = g(y,y))
- Unify $\{(f(x) = f(g(f(z),y))), (x = g(y,y))\} = ?$

3/21/24 14

Example

- x,y,z variables, f,g constructors
- Pick a pair: (x = g(y,y))
- Eliminate x with substitution $\{x \rightarrow g(y,y)\}$
 - Check: x not in g(y,y)
- Unify $\{(f(x) = f(g(f(z),y))), (x = g(y,y))\} = ?$

3/21/24

13

Example

- x,y,z variables, f,g constructors
- Pick a pair: (x = g(y,y))
- Eliminate x with substitution $\{x \rightarrow g(y,y)\}$
- Unify $\{(f(x) = f(g(f(z),y))), (x = g(y,y))\} =$ Unify $\{(f(g(y,y)) = f(g(f(z),y)))\}$ o $\{x \rightarrow g(y,y)\}$

3/21/24 16

Example

- x,y,z variables, f,g constructors
- Unify $\{(f(g(y,y)) = f(g(f(z),y)))\}$ o $\{x \rightarrow g(y,y)\} = ?$

3/21/24

17

Example

- x,y,z variables, f,g constructors
- $\{(f(g(y,y)) = f(g(f(z),y)))\}\$ is non-empty
- Unify $\{(f(g(y,y)) = f(g(f(z),y)))\}$ o $\{x \rightarrow g(y,y)\} = ?$

Example

- x,y,z variables, f,g constructors
- Pick a pair: (f(g(y,y)) = f(g(f(z),y)))
- Unify $\{(f(g(y,y)) = f(g(f(z),y)))\}$ o $\{x \rightarrow g(y,y)\} = ?$

3/21/24

19

Example

- x,y,z variables, f,g constructors
- Pick a pair: (f(g(y,y)) = f(g(f(z),y)))
- Decompose:(f(g(y,y)) = f(g(f(z),y))) becomes {(g(y,y) = g(f(z),y))}
- Unify $\{(f(g(y,y)) = f(g(f(z),y)))\}$ o $\{x \rightarrow g(y,y)\} =$ Unify $\{(g(y,y) = g(f(z),y))\}$ o $\{x \rightarrow g(y,y)\}$

3/21/24 20

Example

- x,y,z variables, f,g constructors
- $\{(g(y,y) = g(f(z),y))\}\$ is non-empty
- Unify $\{(g(y,y) = g(f(z),y))\}$ o $\{x \rightarrow g(y,y)\} = ?$

3/21/24

4

Example

- x,y,z variables, f,g constructors
- Pick a pair: (g(y,y) = g(f(z),y))
- Unify $\{(g(y,y) = g(f(z),y))\}$ o $\{x \rightarrow g(y,y)\} = ?$

3/21/24

Example

- x,y,z variables, f,g constructors
- Pick a pair: (f(g(y,y)) = f(g(f(z),y)))
- Decompose: (g(y,y)) = g(f(z),y)) becomes $\{(y = f(z)); (y = y)\}$
- Unify $\{(g(y,y) = g(f(z),y))\}\ o \{x \rightarrow g(y,y)\} =$ Unify $\{(y = f(z)); (y = y)\}\ o \{x \rightarrow g(y,y)\}$

3/21/24

- v

Example

- x,y,z variables, f,g constructors
- Unify $\{(y = f(z)); (y = y)\} \circ \{x \rightarrow g(y,y)\} = ?$

3/21/24

23

Example

- x,y,z variables, f,g constructors
- {(y = f(z)); (y = y)} o {x→ g(y,y) is nonempty
- Unify $\{(y = f(z)); (y = y)\}\ o \{x \rightarrow g(y,y)\} = ?$

Example

- x,y,z variables, f,g constructors
- Pick a pair: (y = f(z))
- Unify $\{(y = f(z)); (y = y)\}\ o \{x \rightarrow g(y,y)\} = ?$

3/21/24 26

3/21/24

Example

- x,y,z variables, f,g constructors
- Pick a pair: (y = f(z))
- Eliminate y with $\{y \rightarrow f(z)\}$
- Unify {(y = f(z)); (y = y)} o {x→ g(y,y)} =
 Unify {(f(z) = f(z))}
 o ({y → f(z)} o {x→ g(y,y)})=
 Unify {(f(z) = f(z))}
 o {y → f(z); x→ g(f(z), f(z))}

3/21/24

25

Example

- x,y,z variables, f,g constructors
- Unify $\{(f(z) = f(z))\}$ o $\{y \to f(z); x \to g(f(z), f(z))\} = ?$

3/21/24 28

Example

- x,y,z variables, f,g constructors
- $\{(f(z) = f(z))\}$ is non-empty
- Unify $\{(f(z) = f(z))\}$ o $\{y \to f(z); x \to g(f(z), f(z))\} = ?$

3/21/24

29

Example

- x,y,z variables, f,g constructors
- Pick a pair: (f(z) = f(z))
- Unify $\{(f(z) = f(z))\}$ o $\{y \to f(z); x \to g(f(z), f(z))\} = ?$

3/21/24

- x,y,z variables, f,g constructors
- Pick a pair: (f(z) = f(z))
- Delete
- Unify $\{(f(z) = f(z))\}$ o $\{y \to f(z); x \to g(f(z), f(z))\} =$ Unify $\{\}$ o $\{y \to f(z); x \to g(f(z), f(z))\}$

3/21/24 31

- x,y,z variables, f,g constructors
- Unify {} o { $y \rightarrow f(z)$; $x \rightarrow g(f(z), f(z))$ } = ?

3/21/24 32

Example

- x,y,z variables, f,g constructors
- {} is empty
- Unify {} = identity function
- Unify {} o {y \rightarrow f(z); x \rightarrow g(f(z), f(z))} = {y \rightarrow f(z); x \rightarrow g(f(z), f(z))}

3/21/24

Example

■ Unify $\{(f(x) = f(g(f(z),y))), (g(y,y) = x)\} = \{y \rightarrow f(z); x \rightarrow g(f(z), f(z))\}$

$$f(x) = f(g(f(z), y))$$

$$\rightarrow f(g(f(z), f(z))) = f(g(f(z), f(z)))$$

$$g(y, y) = x$$

$$\rightarrow g(f(z),f(z)) = g(f(z), f(z))$$

3/21/24 34

Example of Failure: Decompose

- Unify $\{(f(x,g(y)) = f(h(y),x))\}$
- Decompose: (f(x,g(y)) = f(h(y),x))
- \blacksquare = Unify {(x = h(y)), (g(y) = x)}
- Orient: (g(y) = x)
- \blacksquare = Unify {(x = h(y)), (x = g(y))}
- Eliminate: (x = h(y))
- Unify $\{(h(y) = g(y))\}\ o \{x \to h(y)\}$
- No rule to apply! Decompose fails!

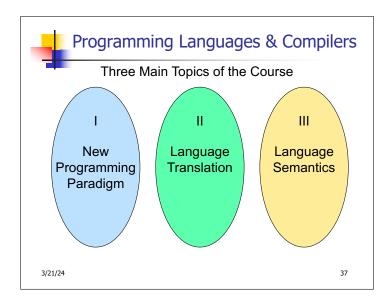

3/21/24

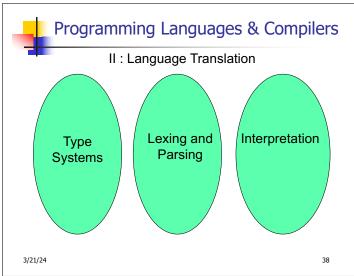

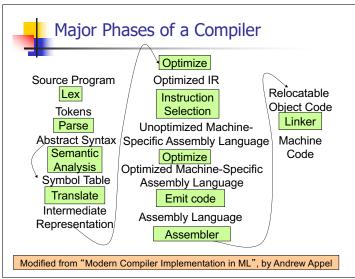

35

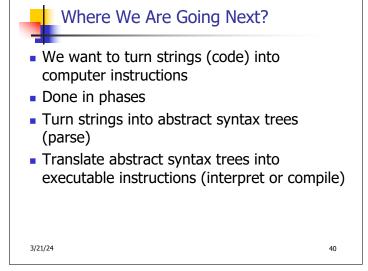

Example of Failure: Occurs Check

- Unify $\{(f(x,g(x)) = f(h(x),x))\}$
- Decompose: (f(x,g(x)) = f(h(x),x))
- \blacksquare = Unify {(x = h(x)), (g(x) = x)}
- Orient: (g(x) = x)
- \blacksquare = Unify {(x = h(x)), (x = g(x))}
- No rules apply.

Meta-discourse

- Language Syntax and Semantics
- Syntax
 - Regular Expressions, DFSAs and NDFSAs
 - Grammars
- Semantics
 - Natural Semantics
 - Transition Semantics

3/21/24

41

Language Syntax

- Syntax is the description of which strings of symbols are meaningful expressions in a language
- It takes more than syntax to understand a language; need meaning (semantics) too
- Syntax is the entry point

Syntax of English Language

Pattern 1

Subject	Verb
David	sings
The dog	barked
Susan	yawned

Pattern 2

Subject	Verb	Direct Object
David	sings	ballads
The professor	wants	to retire
The jury	found	the defendant guilty

3/21/24 43

Elements of Syntax

- Character set previously always ASCII, now often 64 character sets
- Keywords usually reserved
- Special constants cannot be assigned to
- Identifiers can be assigned to
- Operator symbols
- Delimiters (parenthesis, braces, brackets)
- Blanks (aka white space)

3/21/24 44

Elements of Syntax

Expressions

if ... then begin ...; ... end else begin ...; ... end

Type expressions

typexpr₁ -> typexpr₂

Declarations (in functional languages)

let pattern = expr

Statements (in imperative languages)

a = b + c

Subprograms

let $pattern_1 = expr_1$ in expr

3/21/24

Elements of Syntax

- Modules
- Interfaces
- Classes (for object-oriented languages)

3/21/24

46

Lexing and Parsing

- Converting strings to abstract syntax trees done in two phases
 - Lexing: Converting string (or streams of characters) into lists (or streams) of tokens (the "words" of the language)
 - Specification Technique: Regular Expressions
 - Parsing: Convert a list of tokens into an abstract syntax tree
 - Specification Technique: BNF Grammars

Formal Language Descriptions

- Regular expressions, regular grammars, finite state automata
- Context-free grammars, BNF grammars, syntax diagrams
- Whole family more of grammars and automata – covered in automata theory

3/21/24 48

3/21/24

Grammars

- Grammars are formal descriptions of which strings over a given character set are in a particular language
- Language designers write grammar
- Language implementers use grammar to know what programs to accept
- Language users use grammar to know how to write legitimate programs

3/21/24 49

Regular Expressions - Review

- Start with a given character set –a, b, c...
- ∠(ε) = {""}
- Each character is a regular expression
 - It represents the set of one string containing just that character
 - $L(a) = \{a\}$

3/21/24 50

Regular Expressions

- If x and y are regular expressions, then xy is a regular expression
 - It represents the set of all strings made from first a string described by x then a string described by

If $L(x) = \{a,ab\}$ and $L(y) = \{c,d\}$ then $L(xy) = \{ac,ad,abc,abd\}$

3/21/24

4

Regular Expressions

- If x and y are regular expressions, then x∨y is a regular expression
 - It represents the set of strings described by either x or y

If $L(x) = \{a,ab\}$ and $L(y) = \{c,d\}$ then $L(x \lor y) = \{a,ab,c,d\}$

3/21/24 52

Regular Expressions

- If x is a regular expression, then so is (x)
 - It represents the same thing as x
- If x is a regular expression, then so is x*
 - It represents strings made from concatenating zero or more strings from x

If $L(x) = \{a,ab\}$ then $L(x^*) = \{$ ",a,ab,aa,aab,abab,... $\}$

- **=** 8
 - It represents {""}, set containing the empty string
- Ф
 - It represents { }, the empty set

3/21/24

53

Example Regular Expressions

- **(0**\sqrt{1})*1
 - The set of all strings of 0's and 1's ending in 1, {1, 01, 11,...}
- a*b(a*)
 - The set of all strings of a's and b's with exactly one b
- **((01)** \(\sigma(10))*
 - You tell me
- Regular expressions (equivalently, regular grammars) important for lexing, breaking strings into recognized words

Right Regular Grammars

- Subclass of BNF (covered in detail sool)
- Only rules of form

<nonterminal>::=<terminal><nonterminal> or <nonterminal>::=<terminal> or

<nonterminal>::=€

- Defines same class of languages as regular expressions
- Important for writing lexers (programs that convert strings of characters into strings of tokens)
- Close connection to nondeterministic finite state automata – nonterminals ≅ states; rule ≅ edge

3/21/24

Example

Right regular grammar:

<Balanced $> ::= \varepsilon$

<Balanced> ::= 0<OneAndMore>

<Balanced> ::= 1<ZeroAndMore>

<OneAndMore> ::= 1<Balanced>

<ZeroAndMore> ::= 0<Balanced>

 Generates even length strings where every initial substring of even length has same number of 0's as 1's

3/21/24 56

Implementing Regular Expressions

- Regular expressions reasonable way to generate strings in language
- Not so good for recognizing when a string is in language
- Problems with Regular Expressions
 - which option to choose,
 - how many repetitions to make
- Answer: finite state automata
- Should have seen in CS374

3/21/24

57

59

Example: Lexing

- Regular expressions good for describing lexemes (words) in a programming language
 - Identifier = (a ∨ b ∨ ... ∨ z ∨ A ∨ B ∨ ... ∨ Z) (a ∨ b ∨ ... ∨ z ∨ A ∨ B ∨ ... ∨ Z ∨ 0 ∨ 1 ∨ ... ∨ 9)*

58

- Digit = $(0 \lor 1 \lor ... \lor 9)$
- Number = $0 \lor (1 \lor ... \lor 9)(0 \lor ... \lor 9)^* \lor \sim (1 \lor ... \lor 9)(0 \lor ... \lor 9)^*$
- Keywords: if = if, while = while,...

3/21/24

Lexing

Different syntactic categories of "words": tokens

Example:

- Convert sequence of characters into sequence of strings, integers, and floating point numbers.
- "asd 123 jkl 3.14" will become: [String "asd"; Int 123; String "jkl"; Float 3.14]

3/21/24

Lex, ocamllex

- Could write the reg exp, then translate to DFA by hand
 - A lot of work
- Better: Write program to take reg exp as input and automatically generates automata
- Lex is such a program
- ocamllex version for ocaml

How to do it

- To use regular expressions to parse our input we need:
 - Some way to identify the input string— call it a lexing buffer
 - Set of regular expressions,
 - Corresponding set of actions to take when they are matched.

3/21/24 61

How to do it

- The lexer will take the regular expressions and generate a state machine.
- The state machine will take our lexing buffer and apply the transitions...
- If we reach an accepting state from which we can go no further, the machine will perform the appropriate action.

3/21/24 62

Mechanics

- Put table of reg exp and corresponding actions (written in ocaml) into a file < filename>.mll
- Call

ocamllex < filename > .mll

 Produces Ocaml code for a lexical analyzer in file <filename>.ml

3/21/24

Sample Input

```
rule main = parse
['0'-'9']+ { print_string "Int\n"}
| ['0'-'9']+'.'['0'-'9']+ { print_string "Float\n"}
| ['a'-'z']+ { print_string "String\n"}
| _ { main lexbuf }
{
let newlexbuf = (Lexing.from_channel stdin) in main newlexbuf
}
```

3/21/24 64

General Input

```
{ header }
let ident = regexp ...
rule entrypoint [arg1... argn] = parse
    regexp { action }
    | ...
    | regexp { action }
and entrypoint [arg1... argn] = parse ...and
...
{ trailer }
```

Ocamllex Input

- header and trailer contain arbitrary ocaml code put at top an bottom of <filename>.ml
- let ident = regexp ... Introduces ident for use in later regular expressions

Ocamllex Input

- <filename>.ml contains one lexing function per entrypoint
 - Name of function is name given for entrypoint
 - Each entry point becomes an Ocaml function that takes n+1 arguments, the extra implicit last argument being of type Lexing.lexbuf
- arg1... argn are for use in action

3/21/24

Ocamllex Regular Expression

- Single quoted characters for letters:
 'a'
- _: (underscore) matches any letter
- Eof: special "end_of_file" marker
- Concatenation same as usual
- "string": concatenation of sequence of characters
- \bullet e_1/e_2 : choice what was $e_1 \lor e_2$

3/21/24 68

Ocamllex Regular Expression

- [c₁ c₂]: choice of any character between first and second inclusive, as determined by character codes
- [^c₁ c₂]: choice of any character NOT in set
- e*: same as before
- e+: same as e e*
- e?: option was $e \vee \epsilon$
- **■** (*e*): same as *e*

3/21/24

69

67

Ocamllex Regular Expression

- e₁# e₂: the characters in e₁ but not in e₂; e₁ and e₂ must describe just sets of characters
- ident: abbreviation for earlier reg exp in let ident = regexp
- e₁ as id: binds the result of e₁ to id to be used in the associated action

3/21/24 70

Ocamllex Manual

 More details can be found at Version for ocaml 4.07:

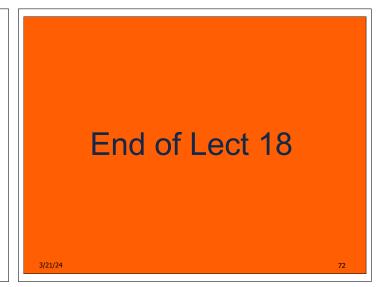

https://v2.ocaml.org/releases/4.07/htmlman/lexyacc.html

Current version (ocaml 4.14)

https://v2.ocaml.org/releases/4.14/htmlman/lexyacc.html

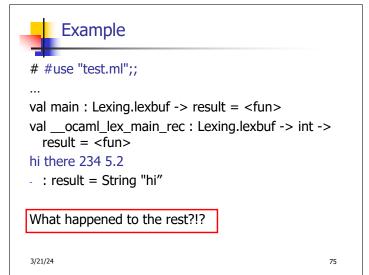

(same, except formatting, I think)

3/21/24

```
Example : test.mll

{ type result = Int of int | Float of float |
   String of string }
let digit = ['0'-'9']
let digits = digit +
let lower_case = ['a'-'z']
let upper_case = ['A'-'Z']
let letter = upper_case | lower_case
let letters = letter +
```

let b = Lexing.from_channel stdin;;
main b;;
hi 673 there
-: result = String "hi"
main b;;
-: result = Int 673
main b;;
-: result = String "there"

Your Turn

- Work on MP8
 - Add a few keywords
 - Implement booleans and unit
 - Implement Ints and Floats
 - Implement identifiers

Problem

- How to get lexer to look at more than the first token at one time?
- Answer: action has to tell it to -- recursive calls
 - Not what you want to sew this together with ocamlyacc

78

- Side Benefit: can add "state" into lexing
- Note: already used this with the _ case

3/21/24

3/21/24

```
hi there 234 5.2
-: result list = [String "hi"; String "there"; Int 234; Float 5.2]
#

Used Ctrl-d to send the end-of-file signal
```

```
Dealing with nested comments
rule main = parse ...
                       { comment 1 lexbuf}
open comment
                  { [] }
l eof
| _ { main lexbuf }
and comment depth = parse
                      { comment (depth+1) lexbuf
  open_comment
| close_comment
                      \{ \text{ if depth} = 1 \}
                 then main lexbuf
                 else comment (depth - 1) lexbuf }
                { comment depth lexbuf }
1_
3/21/24
                                                 83
```

```
Dealing with nested comments
rule main = parse
 (digits) '.' digits as f { Float (float_of_string f) ::
  main lexbuf}
| digits as n
                   { Int (int of string n) :: main
  lexbuf }
| letters as s
                   { String s :: main lexbuf}
                        { (comment 1 lexbuf}
open_comment
l eof
                  {[]}
| _ { main lexbuf }
3/21/24
                                                  84
```

Dealing with nested comments

```
and comment depth = parse
                      { comment (depth+1) lexbuf
 open_comment
                     \{ \text{ if depth} = 1 \}
| close_comment
                 then main lexbuf
                 else comment (depth - 1) lexbuf }
                { comment depth lexbuf }

3/21/24

85

Types of Formal Language Descriptions

- Regular expressions, regular grammars
- Context-free grammars, BNF grammars, syntax diagrams
- Finite state automata
- Pushdown automata
- Whole family more of grammars and automata - covered in automata theory

3/21/24 86

Sample Grammar

- Language: Parenthesized sums of 0's and 1's
- <Sum> ::= 0
- <Sum >::= 1
- <Sum> ::= <Sum> + <Sum>
- <Sum> ::= (<Sum>)

3/21/24

BNF Grammars

- Start with a set of characters, a,b,c,...
 - We call these terminals
- Add a set of different characters, **X,Y,Z,...**
 - We call these *nonterminals*
- One special nonterminal S called start symbol

3/21/24

BNF Grammars

BNF rules (aka productions) have form

X ::= V

where \mathbf{X} is any nonterminal and y is a string of terminals and nonterminals

■ BNF *grammar* is a set of BNF rules such that every nonterminal appears on the left of some rule

3/21/24

89

Sample Grammar

- Terminals: 0 1 + ()
- Nonterminals: <Sum>
- Start symbol = <Sum>
- <Sum> ::= 0
- <Sum >::= 1
- <Sum> ::= <Sum> + <Sum>
- <Sum> ::= (<Sum>)
- Can be abbreviated as

| <Sum> + <Sum> | (<Sum>)

3/21/24

BNF Deriviations

$$X::= yZw$$
 and $Z::=v$

we may replace **Z** by ν to say

- Sequence of such replacements called derivation
- Derivation called *right-most* if always replace the right-most non-terminal

3/21/24

BNF Derivations

Start with the start symbol:

3/21/24

92

BNF Derivations

Pick a non-terminal

3/21/24

1

BNF Derivations

- Pick a rule and substitute:
 - <Sum> ::= <Sum> + <Sum>

BNF Derivations

Pick a non-terminal:

3/21/24

BNF Derivations

Pick a rule and substitute:

3/21/24

3/21/24

95

BNF Derivations

Pick a non-terminal:

3/21/24

BNF Derivations

- Pick a rule and substitute:
- <Sum> ::= <Sum> + <Sum>

3/21/24 98

BNF Derivations

Pick a non-terminal:

3/21/24

97

99

101

BNF Derivations

- Pick a rule and substitute:
 - <Sum >::= 1

3/21/24 100

BNF Derivations

Pick a non-terminal:

3/21/24

BNF Derivations

- Pick a rule and substitute:
 - Sum >::= 0

3/21/24

BNF Derivations

Pick a non-terminal:

3/21/24

103

BNF Derivations

■ Pick a rule and substitute

3/21/24 104

BNF Derivations

 \bullet (0 + 1) + 0 is generated by grammar

3/21/24

105

Pick a non-terminal:
