

# CS 421 – Programming Languages and Compilers

---

Welcome!

Today's class:

- ▶ Staff
- ▶ Why 421?
- ▶ Class structure and policies
- ▶ Intro to OCaml
- ▶ Assignment of hwk 1 (due Friday)

## Staff

---

Professor: Sam Kamin, 4237 SC, 3-8069

Office hrs: TBD

TAs: Dongyun Jin (TBD)

Baris Aktemur (TBD)

William Mansky (TBD)

Web page:

<http://www.cs.uiuc.edu/class/cs421/>

Newsgroup: news.cs.uiuc.edu – class.cs421

---

# Why 421?

---

## Why learn about compilers?

- ▶ Complete picture of how programs go from keyboard to execution
- ▶ Understand translation from high-level language to machine language
- ▶ Learn to build compilers and other programs that process structured input
- ▶ Learn interesting algorithms

# Why 421?

---

Why learn about languages?

- ▶ Increase ability to learn new languages
- ▶ Learn correct terminology for describing languages
- ▶ Become better programmers by seeing different perspectives on programming

# Class structure

---

- ▶ Lectures Wednesday and Friday. Notes posted after class. *Strongly advise taking notes in class.*
- ▶ Weekly assignments
- ▶ Programming in OCaml
- ▶ Grades
- ▶ Cheating
- ▶ Lateness

# Class structure

---

## Topics:

- ▶ First half: Compilers
  - ▶ First 2 ½ classes: OCaml
- ▶ Second half: Languages

Full details on web page

# OCaml

---

- ▶ Functional programming language
  - ▶ One of the two leading language paradigms (the other is object-oriented)
  - ▶ Defined mainly by *no assignment statements*
    - ▶ Heavy use of *dynamically-allocated data structures* and *recursion*
- ▶ Everything we will do in the first half of the class could also be done in Java, but:
  - ▶ OCaml notationally much more concise
  - ▶ Using OCaml now will prepare you for more advanced uses of OCaml in second half

# OCaml

---

- ▶ Interactive system

```
> ocaml  
# 3 + 4 ;;  
7 : int
```

- ▶ Load files: #use "filename";;

```
# #use "..." ;;
```

# OCaml

---

## ▶ Define variables and functions

# let  $x = 3$ ;;  
# let  $f x = x + 1$ ;; — Java:  $\text{int } f(\text{int } x) \{$   
# let  $y = y + 1$ ;; —  $\text{return } x + 1;$   
# let  $x = 4$ ;;  $\}$   
# let  $g y = y + x$ ;; Java:  $\text{int } f(\text{int } y) \{$   
 $f 10 \Rightarrow 13$   $\text{return } y + x;$   
 $\}$

## ▶ Functions of multiple arguments:

let  $f x y = x + y$ ;; Java:  $\text{int } f(\text{int } x, \text{int } y) \{$   
 $f: \text{int} \rightarrow \text{int} \rightarrow \text{int}$   $\text{return } x + y;$   
 $\}$

---

# OCaml

---

- ▶ Arithmetic and comparison operators: usual.
- ▶ Boolean operators: `&&`, `||`, `not`      `=`, `not` `==`
- ▶ Conditional expressions

```
let f x = if x > 0 then x + 10
          else x * 3;;
```

```
f 3;;
13 : int
```

```
Java: int f (int x) {
    return x > 0 ? x + 10
               : x * 3;
}
```

# OCaml

---

- ▶ Use of parentheses    Java: Precedence  
Only for precedence    Function appli.  
                                          Cest operator

$$(f\ x) + 3 \quad f(x + 3) \quad (f\ x) + 3$$

- ▶ Strings: "...", ^ for concatenation. (String module contains length, get, etc.)

# open String ;  
# length "...";

$$f(x) + 3$$

silly

# OCaml

---

- ▶ Characters: 'c' (int\_of\_char, char\_of\_int)

~~'c' + 1~~      int\_of\_char 'c' + 1

- ▶ Printing to console: print\_int, print\_string

# OCaml

---

- ▶ Sequencing: use ;.

```
let f x = x+1;;
```

```
let g = f;;
```

```
let f x = print_int x; x+1;;
```

```
let g y = y+1; y+2;;
```

- ▶ Comments: (\* ... \*)

Like "old-style" C comments: /\* \*/

except they nest: (/\* ... (/\* ... \*/ ... \*/)

```
/* ... /* ... */ ... */
```

# OCaml

---

## ▶ Recursive function definitions

*let rec f X = ... f (x-1) ...*

# Homework 1 – due Friday

---

- ▶ Define a few simple functions.
