Background for Unification

- Terms made from constructors and variables (for the simple first order case)
- Constructors may be applied to arguments (other terms) to make new terms
- Variables and constructors with no arguments are base cases
- Constructors applied to different number of arguments (arity) considered different
- Substitution of terms for variables

Unification Problem

Given a set of pairs of terms ("equations")

$$\{(s_1, t_1), (s_2, t_2), \ldots, (s_n, t_n)\}$$

(the *unification problem*) does there exist a substitution σ (the *unification solution*) of terms for variables such that

$$\sigma(s_i) = \sigma(t_i),$$

for all $i = 1, \ldots, n$?

Unification Algorithm

- Let $S = \{(s_1 = t_1), (s_2 = t_2), \ldots, (s_n = t_n)\}$ be a unification problem.

- Case $S = \{\ \}$: $\mathrm{Unif}(S)$ = Identity function (i.e., no substitution)

- Case $S = \{(s, t)\} \cup S'$: Four main steps

Unification Algorithm

- Delete: if $s = t$ (they are the same term) then $\text{Unif}(S) = \text{Unif}(S')$
- Decompose: if $s = f(q_1, \ldots, q_m)$ and $t = g(r_1, \ldots, r_n)$ if $f = g$, $m = n$, then $\text{Unif}(S) = \text{Unif}(\{(q_1, r_1), \ldots, (q_m, r_m)\} \cup S')$ else **fail**!
- Orient: if $t = x$ is a variable, and s is not a variable, $\text{Unif}(S) = \text{Unif}(\{(x = s)\} \cup S')$

Unification Algorithm

- Eliminate: if $s = x$ is a variable, then if x does not occur in t (the occurs check), then
  - Let $\varphi = \{x \rightarrow t\}$
    - $\mathrm{Unif}(S) = \mathrm{Unif}(\varphi(S'))\ o\ \{x \rightarrow t\}$
  - Let $\psi = \mathrm{Unif}(\varphi(S'))$
  - $\mathrm{Unif}(S) = \{x \rightarrow \psi(t)\}\ o\ \psi$
    - Note: $\{x \rightarrow a\}\ o\ \{y \rightarrow b\} = \{y \rightarrow (\{x \rightarrow a\}(b))\}\ o\ \{x \rightarrow a\}$ if y not in a

  else **fail** (because of occurs check failure)
