– Projective geometry
  • Vanishing points and lines
– Projection matrix
Image formation

Let’s design a camera
  – Idea 1: put a piece of film in front of an object
  – Do we get a reasonable image?

Slide source: Seitz
Pinhole camera

Idea 2: add a barrier to block off most of the rays
  – This reduces blurring
  – The opening known as the aperture

Projective Geometry

What is lost?

• Length

Who is taller?

Which is closer?
Length is not preserved
Projective Geometry

What is lost?

- Length
- Angles
Projective Geometry

What is preserved?
• Straight lines are still straight
Vanishing points and lines

Parallel lines in the world intersect in the image at a “vanishing point”
Vanishing points and lines

- The projections of parallel 3D lines intersect at a **vanishing point**
- The projection of parallel 3D planes intersect at a **vanishing line**
- If a set of parallel 3D lines are also parallel to a particular plane, their vanishing point will lie on the vanishing line of the plane
- Not all lines that intersect are parallel
- Vanishing point <-> 3D direction of a line
- Vanishing line <-> 3D orientation of a surface

  \[
  \text{line}_i = \begin{bmatrix}
  a_i \\
  b_i \\
  c_i
  \end{bmatrix}
  \]

- Append 1 to pixel coordinate to get homogeneous coordinate
  
  \[
  p_i = \begin{bmatrix}
  u_i \\
  v_i \\
  1
  \end{bmatrix}
  \]

- Line given by cross product of two points
  
  \[
  \text{line}_{ij} = p_i \times p_j

  \[
  q_{ij} = \text{line}_i \times \text{line}_j

Take-home questions

• Suppose the camera axis is in the direction of \((x=0, y=0, z=1)\) in its own coordinate system. What is the camera axis in world coordinates given the extrinsic parameters \(R, t\)?

• Suppose a camera at height \(y=h\ \ (x=0, z=0)\) observes a point at \((u,v)\) known to be on the ground \((y=0)\). Assume \(R\) is identity. What is the 3D position of the point in terms of \(f, u_0, v_0\)?
