Image-based Lighting (Part 2)

Computational Photography Derek Hoiem, University of Illinois

Many slides from Debevec, some from Efros, Kevin Karsch

Today

• Brief review of last class

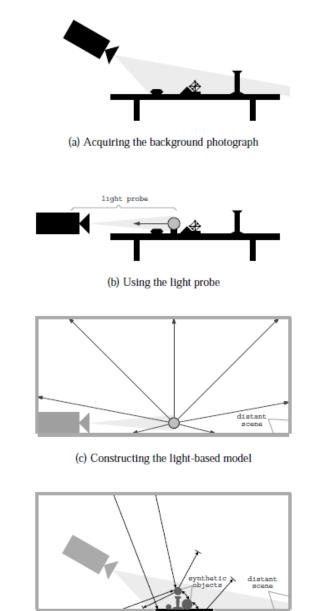

• Show how to get an HDR image from several LDR images, and how to display HDR

Show how to insert fake objects into real scenes using environment maps

How to render an object inserted into an image?

Image-based lighting

- Capture incoming light with a "light probe"
- Model local scene
- Ray trace, but replace distant scene with info from light probe

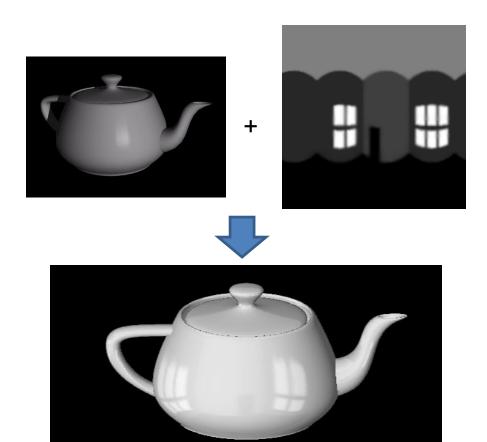

Debevec SIGGRAPH 1998

(d) Computing the global illumination solution

Key ideas for Image-based Lighting

• Environment maps: tell what light is entering at each angle within some shell

Spherical Map Example

Key ideas for Image-based Lighting

• Light probes: a way of capturing environment maps in real scenes

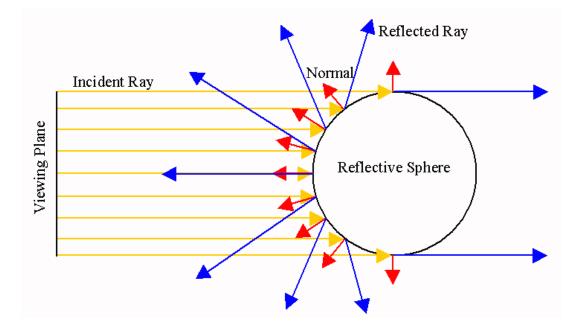

Mirrored Sphere

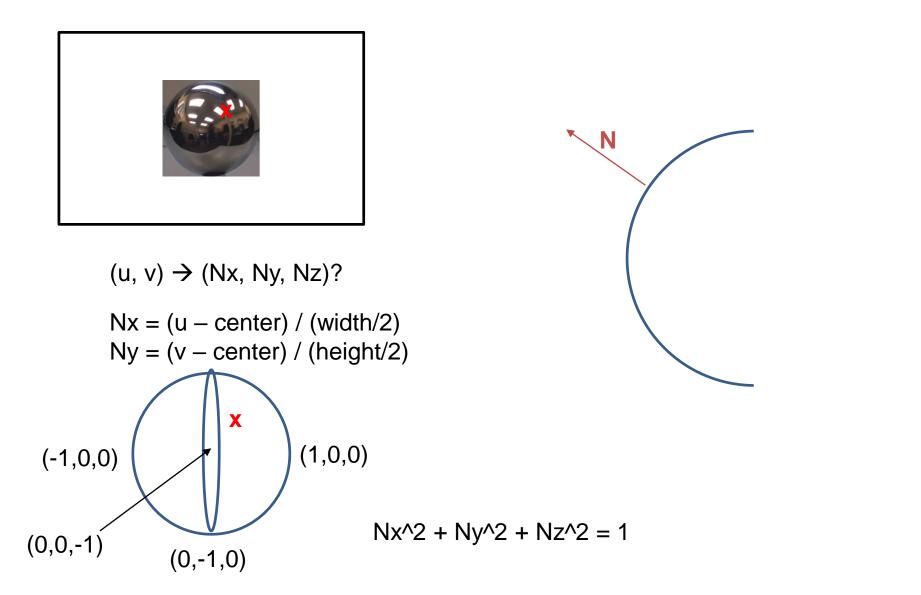

One picture of a mirrored ball received light coming into the ball from nearly all angles (including behind)

Assume camera is roughly same height as light probe and is sufficiently distant, so all viewing rays that hit light probe are roughly in direction of z-axis

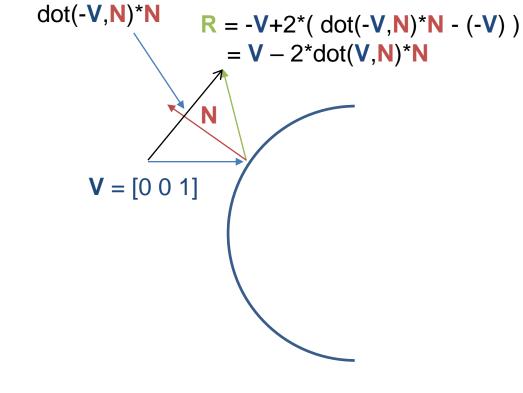

Solving for normal vector

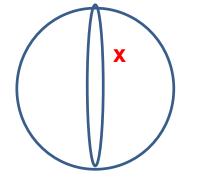

Solving for reflection vector

```
(u, v) \rightarrow (Nx, Ny, Nz)
```

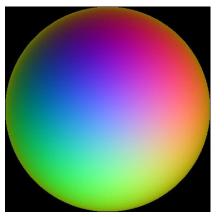

Mirror ball -> equirectangular

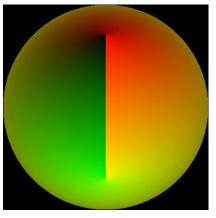

Normals

Reflection vectors

Phi/theta of reflection vecs

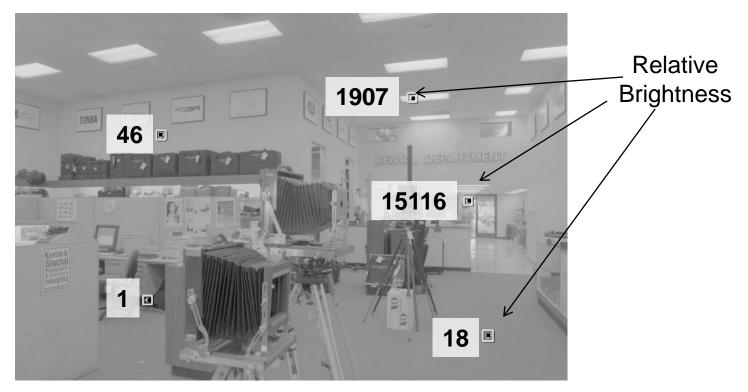

Equirectangular

Phi/theta equirectangular domain

One small snag

- How do we deal with light sources? Sun, lights, etc?
 - They are much, much brighter than the rest of the environment

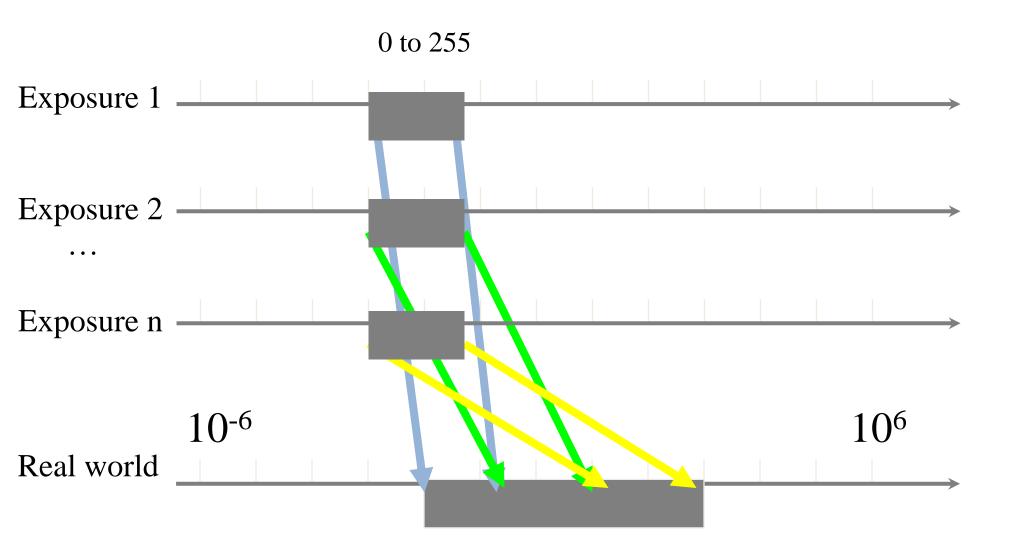

• Use High Dynamic Range photography!

Key ideas for Image-based Lighting

• Capturing HDR images: needed so that light probes capture full range of radiance

LDR->HDR by merging exposures

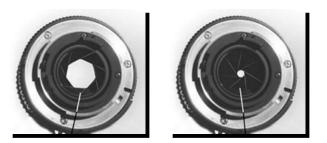

High dynamic range

Ways to vary exposure

Shutter Speed

F/stop (aperture, iris)

Neutral Density (ND) Filters

Recovering High Dynamic Range Radiance Maps from Photographs

Paul E. Debevec Jitendra Malik

University of California at Berkeley¹

SIGGRAPH 1997

The Approach

- Get pixel values Z_{ij} for image with shutter time Δt_j (i^{th} pixel location, j^{th} image)
- Exposure is irradiance integrated over time:

$$E_{ij} = R_i \cdot Dt_j$$

• Pixel values are non-linearly mapped E_{ij} 's:

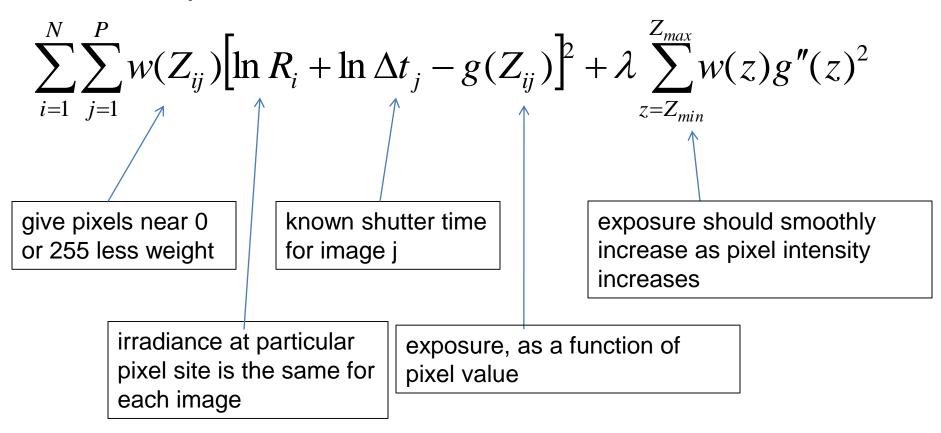

$$Z_{ij} = f(E_{ij}) = f(R_i \cdot \mathsf{D}t_j)$$

• Rewrite to form a (not so obvious) linear system:

$$\ln f^{-1}(Z_{ij}) = \ln(R_i) + \ln(\mathsf{D}t_j)$$
$$g(Z_{ij}) = \ln(R_i) + \ln(\mathsf{D}t_j)$$

The objective

Solve for radiance *R* and mapping *g* for each of 256 pixel values to minimize:

Matlab Code

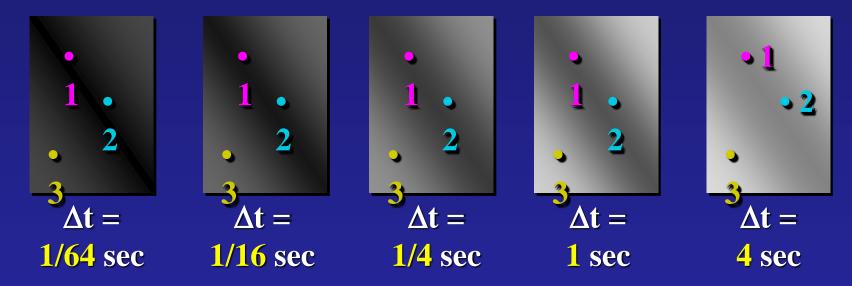

```
% goolve.m - Solve for imaging system response function
% Given a set of pixel values observed for several pixels in several
% images with different exposure times, this function returns the
% imaging system's response function g as well as the log film irradiance
% values for the observed pixels.
% Accumer:
<u>s</u>.
% Zmin = 0
% Zmax = 255
% Arguments:
<u>s</u>.
% Z(i,j) is the pixel values of pixel location number i in image j
% B(j) is the log delta t, or log shutter speed, for image j
% 1 is lamdba, the constant that determines the amount of smoothness
% w(z) is the weighting function value for pixel value z
<u>s</u>.
% Returns:
$
g(z) is the log exposure corresponding to pixel value z
% IE(i) is the log film irradiance at pixel location i
٩.
function [g,1E]-gsolve(Z,B,1,w)
n = 256;
A = zeros(size(Z,1)*size(Z,2)+n+1,n+size(Z,1));
b = zeros(size(A,1),1);
%% Include the data-fitting equations
k = 1;
for i=1:size(Z,1)
  for j=1:size(Z,2)
    wij = w(Z(i,j)+1);
A(k,Z(i,j)+1) = wij; A(k,n+i) = -wij;
                                                        b(k,1) = wij * B(i,j);
     k=k+1;
  end
end
%% Fix the curve by setting its middle value to 0
A(k,129) = 1;
k=k+1;
%% Include the smoothness equations
for i=1:n-2
  A(k,i)=1*w(i+1);
                              A(k,i+1) = -2*1*w(i+1); A(k,i+2) = 1*w(i+1);
  k=k+1;
end
%% Solve the system using SVD
x = A \setminus b
g = x(1:n);
1E = x(n+1:size(x,1));
```

Matlab Code

```
function [g,lE]=gsolve(Z,B,l,w)
n = 256;
A = \operatorname{zeros}(\operatorname{size}(\mathbb{Z}, 1) * \operatorname{size}(\mathbb{Z}, 2) + n + 1, n + \operatorname{size}(\mathbb{Z}, 1));
b = zeros(size(A, 1), 1);
         %% Include the data-fitting equations
k = 1;
for i=1:size(Z,1)
  for j=1:size(Z,2)
    wij = w(Z(i, j) + 1);
    A(k,Z(i,j)+1) = wij; A(k,n+i) = -wij; b(k,1) = wij * B(j);
    k=k+1;
  end
end
for i=1:n-2 %% Include the smoothness equations
 A(k,i) = 1 * w(i+1); A(k,i+1) = -2 * 1 * w(i+1); A(k,i+2) = 1 * w(i+1);
 k=k+1;
end
                %% Fix the curve by setting its middle value to 0
A(k, 129) = 1;
k=k+1;
x = A \setminus b;
          %% Solve the system using pseudoinverse
q = x(1:n);
lE = x(n+1:size(x,1));
```

Illuminating a Small Scene

We can now illuminate synthetic objects with real light.

- Environment map
- Light probe
- HDR
- Ray tracing

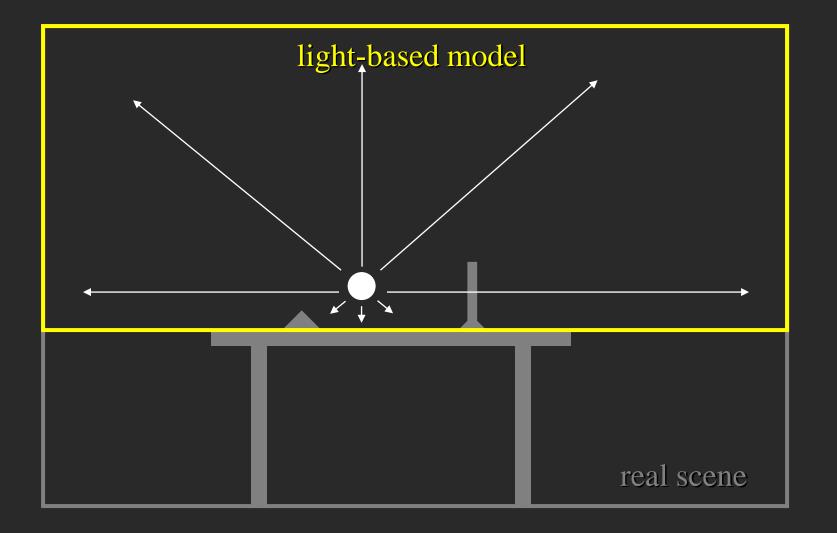

How do we add synthetic objects to a real scene?

Real Scene Example

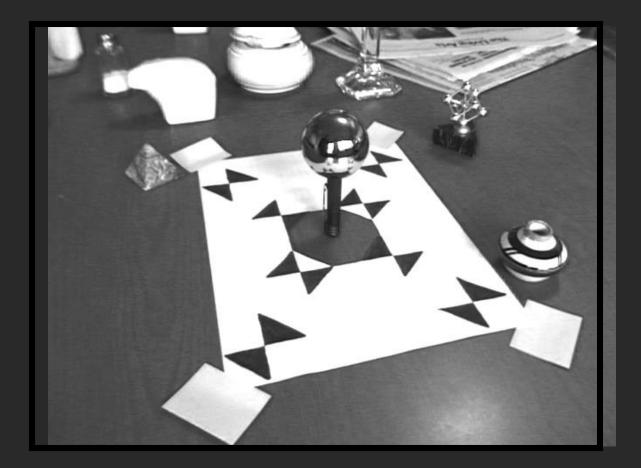

Goal: place synthetic objects on table

Video

Summary

- Real scenes have complex geometries and materials that are difficult to model
- We can use an environment map, captured with a light probe, as a replacement for distance lighting
- We can get an HDR image by combining bracketed shots
- We can relight objects at that position using the environment map
