## Definitions

## Definition (Informal)

Random variable: a function from probability space to $\mathbb{R}$. Associates value $\forall$ atomic events in probability space.

## Definition

The conditional probability of $\boldsymbol{X}$ given $\boldsymbol{Y}$ is

$$
\operatorname{Pr}[X=x \mid Y=y]=\frac{\operatorname{Pr}[(X=x) \cap(Y=y)]}{\operatorname{Pr}[Y=y]}
$$

Equivalent to

## Probability - quick review

## Definitions

## Definition (Informal)

Random variable: a function from probability space to $\mathbb{R}$. Associates value $\forall$ atomic events in probability space.

## Definition

The conditional probability of $\boldsymbol{X}$ given $\boldsymbol{Y}$ is

$$
\operatorname{Pr}[X=x \mid Y=y]=\frac{\operatorname{Pr}[(X=x) \cap(Y=y)]}{\operatorname{Pr}[Y=y]}
$$

Equivalent to

## Probability - quick review

## Even more definitions

## Definition

The events $\boldsymbol{X}=\boldsymbol{x}$ and $\boldsymbol{Y}=\boldsymbol{y}$ are independent, if

$$
\operatorname{Pr}[\boldsymbol{X}=\boldsymbol{x} \cap \boldsymbol{Y}=\boldsymbol{y}]=\operatorname{Pr}[\boldsymbol{X}=\boldsymbol{x}] \cdot \operatorname{Pr}[\boldsymbol{Y}=\boldsymbol{y}]
$$

## Definition

The expectation of a random variable $\boldsymbol{X}$ its average value

## Probability - quick review

## Even more definitions

## Definition

The events $\boldsymbol{X}=\boldsymbol{x}$ and $\boldsymbol{Y}=\boldsymbol{y}$ are independent, if

$$
\begin{aligned}
& \operatorname{Pr}[\boldsymbol{X}=\boldsymbol{x} \cap \boldsymbol{Y}=\boldsymbol{y}]=\operatorname{Pr}[\boldsymbol{X}=\boldsymbol{x}] \cdot \operatorname{Pr}[\boldsymbol{Y}=\boldsymbol{y}] . \\
\equiv & \operatorname{Pr}[\boldsymbol{X}=\boldsymbol{x} \mid \boldsymbol{Y}=\boldsymbol{y}]=\operatorname{Pr}[\boldsymbol{X}=\boldsymbol{x}] .
\end{aligned}
$$

## Definition

The expectation of a random variable $\boldsymbol{X}$ its average value:

$$
\mathbf{E}[\boldsymbol{X}]=\sum_{x} x \cdot \operatorname{Pr}[\boldsymbol{X}=\boldsymbol{x}]
$$

## Linearity of expectations

## Lemma (Linearity of expectation.)

$\forall$ random variables $\boldsymbol{X}$ and $\boldsymbol{Y}: \mathbf{E}[\boldsymbol{X}+\boldsymbol{Y}]=\mathbf{E}[\boldsymbol{X}]+\mathbf{E}[\boldsymbol{Y}]$.

## Proof.

Use definitions, do the math. See notes for details.

## Probability - quick review

## Conditional Expectation

## Definition

$\boldsymbol{X}, \boldsymbol{Y}$ : random variables. The conditional expectation of $\boldsymbol{X}$ given $\boldsymbol{Y}$ (i.e., you know $\boldsymbol{Y}=\boldsymbol{y}$ ):

$$
\mathbf{E}[\boldsymbol{X} \mid \boldsymbol{Y}]=\mathbf{E}[\boldsymbol{X} \mid \boldsymbol{Y}=\boldsymbol{y}]=\sum_{x} \boldsymbol{x} * \operatorname{Pr}[\boldsymbol{X}=\boldsymbol{x} \mid \boldsymbol{Y}=\boldsymbol{y}]
$$

$\mathrm{E}[\boldsymbol{X}]$ is a number.
$\boldsymbol{f}(\boldsymbol{y})=\mathrm{E}[\boldsymbol{X} \mid \boldsymbol{Y}=\boldsymbol{y}]$ is a function.

## Conditional Expectation

## Lemma

$\forall \boldsymbol{X}, \boldsymbol{Y}$ (not necessarily independent): $\mathbf{E}[\boldsymbol{X}]=\mathbf{E}[\mathrm{E}[\boldsymbol{X} \mid \boldsymbol{Y}]]$.

## Proof.

Use definitions, and do the math. See class notes.

## Conditional Expectation

## Lemma

$\forall \boldsymbol{X}, \boldsymbol{Y}$ (not necessarily independent): $\mathbf{E}[\boldsymbol{X}]=\mathbf{E}[\mathbf{E}[\boldsymbol{X} \mid \boldsymbol{Y}]]$.
$\mathrm{E}[\mathrm{E}[\boldsymbol{X} \mid \boldsymbol{Y}]]=\mathrm{E}_{y}[\mathrm{E}[\boldsymbol{X} \mid \boldsymbol{Y}=\boldsymbol{y}]]$

## Proof.

Use definitions, and do the math. See class notes.

## Conditional Expectation

## Lemma

$\forall \boldsymbol{X}, \boldsymbol{Y}$ (not necessarily independent): $\mathrm{E}[\boldsymbol{X}]=\mathrm{E}[\mathrm{E}[\boldsymbol{X} \mid \boldsymbol{Y}]]$.
$\mathrm{E}[\mathrm{E}[\boldsymbol{X} \mid \boldsymbol{Y}]]=\mathrm{E}_{y}[\mathrm{E}[\boldsymbol{X} \mid \boldsymbol{Y}=\boldsymbol{y}]]$

## Proof.

Use definitions, and do the math. See class notes.

## 11.3: Sorting Nuts and Bolts

## Sorting Nuts \& Bolts

## Problem (Sorting Nuts and Bolts)

(1) Input: Set $\boldsymbol{n}$ nuts $+\boldsymbol{n}$ bolts.
(2) Every nut have a matching bolt.
(3) All different sizes.
(9) Task: Match nuts to bolts.
 (In sorted order).
(5) Restriction: You can only compare a nut to a bolt.
(6) Q: How to match the $n$ nuts to the $n$ bolts quickly?

$$

## What is running time for randomized algorithms?

More definitions

## Definition

$\operatorname{rank}(\boldsymbol{x})$ : rank of element $\boldsymbol{x} \in \boldsymbol{S}=$ number of elements in $\boldsymbol{S}$ smaller or equal to $\boldsymbol{x}$.

## Nuts and bolts running time

## Theorem

Expected running time MatchNutsAndBolts (QuickSort) is $\boldsymbol{T}(\mathrm{n})=\boldsymbol{O}(\mathrm{n} \log n)$. Worst case is $\boldsymbol{O}\left(n^{2}\right)$.

## Proof.

$\operatorname{Pr}\left[\operatorname{rank}\left(n_{\text {pivot }}\right)=k\right]=\frac{1}{n}$. Thus,

$$
T(n)=\underset{k=\operatorname{rank}\left(n_{\text {pivot }}\right)}{\mathrm{E}}[O(n)+T(k-1)+T(n-k)]
$$

## Nuts and bolts running time

## Theorem

Expected running time MatchNutsAndBolts (QuickSort) is $\boldsymbol{T}(\mathrm{n})=\boldsymbol{O}(\mathrm{n} \log n)$. Worst case is $\boldsymbol{O}\left(n^{2}\right)$.

## Proof.

$\operatorname{Pr}\left[\operatorname{rank}\left(n_{\text {pivot }}\right)=k\right]=\frac{1}{n}$. Thus,

$$
\begin{aligned}
T(n) & =\underset{k=\operatorname{rank}\left(n_{\text {pivot }}\right)}{\mathrm{E}}[O(n)+T(k-1)+T(n-k)] \\
& =O(n)+\underset{k}{\mathrm{E}}[T(k-1)+T(n-k)]
\end{aligned}
$$

## Nuts and bolts running time

## Theorem

Expected running time MatchNutsAndBolts (QuickSort) is $T(n)=O(n \log n)$. Worst case is $O\left(n^{2}\right)$.

## Proof.

$\operatorname{Pr}\left[\operatorname{rank}\left(n_{\text {pivot }}\right)=k\right]=\frac{1}{n}$. Thus,

$$
T(n)=O(n)+\underset{k}{\mathrm{E}}[T(k-1)+T(n-k)]
$$

## Nuts and bolts running time

## Theorem

Expected running time MatchNutsAndBolts (QuickSort) is $\boldsymbol{T}(\mathrm{n})=\boldsymbol{O}(\mathrm{n} \log n)$. Worst case is $\boldsymbol{O}\left(n^{2}\right)$.

## Proof.

$\operatorname{Pr}\left[\operatorname{rank}\left(\boldsymbol{n}_{\text {pivot }}\right)=k\right]=\frac{1}{n}$. Thus,

$$
\begin{aligned}
& T(n)=O(n)+\underset{k}{\mathrm{E}}[T(k-1)+T(n-k)] \\
&=O(n)+\sum_{k=1}^{n} \operatorname{Pr}[ \operatorname{Rank}(P i v o t)=k] \\
& *(T(k-1)+T(n-k))
\end{aligned}
$$

## Nuts and bolts running time

## Theorem

Expected running time MatchNutsAndBolts (QuickSort) is $\boldsymbol{T}(n)=O(n \log n)$. Worst case is $\boldsymbol{O}\left(n^{2}\right)$.

## Proof.

$\operatorname{Pr}\left[\operatorname{rank}\left(n_{\text {pivot }}\right)=k\right]=\frac{1}{n}$. Thus,

$$
\begin{aligned}
T(n)=O(n)+\sum_{k=1}^{n} \operatorname{Pr} & {[\operatorname{Rank}(\operatorname{Pivot})=k] } \\
* & (T(k-1)+T(n-k))
\end{aligned}
$$

## Nuts and bolts running time

## Theorem

Expected running time MatchNutsAndBolts (QuickSort) is $\boldsymbol{T}(\mathrm{n})=\boldsymbol{O}(\mathrm{n} \log n)$. Worst case is $\boldsymbol{O}\left(n^{2}\right)$.

## Proof.

$\operatorname{Pr}\left[\operatorname{rank}\left(\boldsymbol{n}_{\text {pivot }}\right)=k\right]=\frac{1}{n}$. Thus,

$$
\begin{aligned}
T(n)= & O(n)+\sum_{k=1}^{n} \operatorname{Pr}[\operatorname{Rank}(\text { Pivot })=k] \\
& *(T(k-1)+T(n-k)) \\
= & O(n)+\sum_{k=1}^{n} \frac{1}{n} \cdot(T(k-1)+T(n-k))
\end{aligned}
$$

## Nuts and bolts running time

## Theorem

Expected running time MatchNutsAndBolts (QuickSort) is $\boldsymbol{T}(\mathrm{n})=\boldsymbol{O}(\mathrm{n} \log n)$. Worst case is $\boldsymbol{O}\left(n^{2}\right)$.

## Proof.

$\operatorname{Pr}\left[\operatorname{rank}\left(n_{\text {pivot }}\right)=k\right]=\frac{1}{n}$. Thus,

$$
T(n)=O(n)+\sum_{k=1}^{n} \frac{1}{n} \cdot(T(k-1)+T(n-k))
$$

## Nuts and bolts running time

## Theorem

Expected running time MatchNutsAndBolts (QuickSort) is $\boldsymbol{T}(\mathrm{n})=\boldsymbol{O}(\mathrm{n} \log n)$. Worst case is $\boldsymbol{O}\left(n^{2}\right)$.

## Proof.

$\operatorname{Pr}\left[\operatorname{rank}\left(\boldsymbol{n}_{\text {pivot }}\right)=k\right]=\frac{1}{n}$. Thus,

$$
T(n)=O(n)+\sum_{k=1}^{n} \frac{1}{n} \cdot(T(k-1)+T(n-k))
$$

Solution is $T(n)=O(n \log n)$.

11.3.2: What are randomized algorithms?

## Worst case vs. average case

Expected running time of a randomized algorithm is

$$
T(n)=\max _{U \text { is an input of size } n} \mathrm{E}[\mathcal{R T}(\boldsymbol{U})]
$$

Worst case running time of deterministic algorithm:

$$
\boldsymbol{T}(\boldsymbol{n})=\max _{\boldsymbol{U} \text { is an input of size } \boldsymbol{n}} \mathcal{R T}(\boldsymbol{U})
$$

## High Probability running time...

## Definition

Running time Alg is $O(f(n))$ with high probability if

$$
\operatorname{Pr}[\mathcal{R T}(\operatorname{Alg}(n)) \geq c \cdot f(n)]=o(1)
$$

$\Longrightarrow \operatorname{Pr}[\mathcal{R T}(\mathrm{Alg})>c * f(n)] \rightarrow 0$ as $n \rightarrow \infty$.

## Usually use weaker def:

## Technical reasons... also assume that $\mathrm{E}[\mathcal{R T}(\operatorname{Alg}(n))]=O(f(n))$

## High Probability running time...

## Definition

Running time Alg is $O(f(n))$ with high probability if

$$
\operatorname{Pr}[\mathcal{R T}(\operatorname{Alg}(n)) \geq c \cdot f(n)]=o(1)
$$

$\Longrightarrow \operatorname{Pr}[\mathcal{R T}(\mathrm{Alg})>c * f(n)] \rightarrow 0$ as $n \rightarrow \infty$.

## Usually use weaker def:

Running time Alg is $O(f(n))$ with high probability if

$$
\operatorname{Pr}[\mathcal{R T}(\operatorname{Alg}(n)) \geq c \cdot f(n)]=o(1)
$$

$\Longrightarrow \operatorname{Pr}[\mathcal{R T}(\mathrm{Alg})>c * f(n)] \rightarrow 0$ as $n \rightarrow \infty$.
Usually use weaker def:

$$
\operatorname{Pr}[\mathcal{R T}(\operatorname{Alg}(n)) \geq c \cdot f(n)] \leq \frac{1}{n^{d}}
$$

## High Probability running time...

## Definition

Running time Alg is $\boldsymbol{O}(\boldsymbol{f}(\boldsymbol{n}))$ with high probability if

$$
\operatorname{Pr}[\mathcal{R T}(\operatorname{Alg}(n)) \geq c \cdot f(n)]=o(1)
$$

$\Longrightarrow \operatorname{Pr}[\mathcal{R T}(\mathrm{Alg})>c * f(n)] \rightarrow 0$ as $n \rightarrow \infty$.
Usually use weaker def:

$$
\operatorname{Pr}[\mathcal{R T}(\operatorname{Alg}(n)) \geq c \cdot f(n)] \leq \frac{1}{n^{d}}
$$

Technical reasons... also assume that $\mathrm{E}[\mathcal{R T}(\operatorname{Alg}(n))]=O(f(n))$.

## 11.4: Slick analysis of QuickSort

## A Slick Analysis of QuickSort

Let $\boldsymbol{Q}(\boldsymbol{A})$ be number of comparisons done on input array $\boldsymbol{A}$ :
(1) For $1 \leq i<j<\boldsymbol{n}$ let $\boldsymbol{R}_{i j}$ be the event that rank $\boldsymbol{i}$ element is compared with rank $j$ element.
(c) $X_{i j}$ : indicator random variable for $\boldsymbol{R}_{i j}$.
$\boldsymbol{X}_{i j}=1 \Longleftrightarrow$ rank $i$ element compared with rank $j$ element, otherwise $\mathbf{0}$.

and hence by linearity of expectation,

## A Slick Analysis of QuickSort

Let $\boldsymbol{Q}(\boldsymbol{A})$ be number of comparisons done on input array $\boldsymbol{A}$ :
(1) For $1 \leq i<j<\boldsymbol{n}$ let $\boldsymbol{R}_{i j}$ be the event that rank $\boldsymbol{i}$ element is compared with rank $j$ element.
(2) $\boldsymbol{X}_{i j}$ : indicator random variable for $\boldsymbol{R}_{i j}$.
$\boldsymbol{X}_{i j}=1 \Longleftrightarrow$ rank $i$ element compared with rank $j$ element, otherwise 0 .

$$
Q(A)=\sum_{1 \leq i<j \leq n} X_{i j}
$$

and hence by linearity of expectation,

$$
\mathrm{E}[Q(A)]=\sum_{1 \leq i<j \leq n} \mathrm{E}\left[\boldsymbol{X}_{i j}\right]=\sum_{1 \leq i<j \leq n} \operatorname{Pr}\left[\boldsymbol{R}_{i j}\right]
$$

## A Slick Analysis of QuickSort

$\boldsymbol{R}_{\boldsymbol{i j}}=$ rank $\boldsymbol{i}$ element is compared with rank $\boldsymbol{j}$ element.
Question: What is $\operatorname{Pr}\left[\boldsymbol{R}_{i j}\right]$ ?
$\begin{array}{llllllll}7 & 5 & 9 & 1 & 3 & 4 & 8 & 6\end{array}$

## A Slick Analysis of QuickSort

$\boldsymbol{R}_{i j}=$ rank $\boldsymbol{i}$ element is compared with rank $\boldsymbol{j}$ element.
Question: What is $\operatorname{Pr}\left[\boldsymbol{R}_{i j}\right]$ ?

With ranks: | 7 | 5 | 9 | 1 | 3 | 4 | 8 | 6 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 6 | 4 | 8 | 1 | 2 | 3 | 7 | 5 |

## A Slick Analysis of QuickSort

$\boldsymbol{R}_{i j}=$ rank $\boldsymbol{i}$ element is compared with rank $\boldsymbol{j}$ element.
Question: What is $\operatorname{Pr}\left[\boldsymbol{R}_{i j}\right]$ ?

With ranks: | 7 | 5 | 9 | 1 | 3 | 4 | 8 | 6 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 6 | 4 | 8 | 1 | 2 | 3 | 7 | 5 |

As such, probability of comparing 5 to 8 is $\operatorname{Pr}\left[\boldsymbol{R}_{4,7}\right]$.

## A Slick Analysis of QuickSort

$\boldsymbol{R}_{i j}=$ rank $\boldsymbol{i}$ element is compared with rank $\boldsymbol{j}$ element.
Question: What is $\operatorname{Pr}\left[\boldsymbol{R}_{i j}\right]$ ?

With ranks: | 7 | 5 | 9 | 1 | 3 | 4 | 8 | 6 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 6 | 4 | 8 | 1 | 2 | 3 | 7 | 5 |

(1) If pivot too small (say 3 [rank 2]). Partition and call recursively:

$$
\begin{array}{|l|l|l|l|l|l|l|}
\hline 7 & 5 & 9 & 1 & 3 & 4 & 8 \\
\hline
\end{array}
$$

Decision if to compare 5 to 8 is moved to subproblem.

## A Slick Analysis of QuickSort

\hline 7 & 5 & 9 & 1 & 3 & 4 & 6 \\
\hline
\end{array}
$$

(3) If pivot in between the two numbers (say 6 [rank 5]):

| 7 | 5 | 9 | 1 | 3 | 4 | 8 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |

5 and 8 will never be compared to each other.

## A Slick Analysis of QuickSort

Question: What is $\operatorname{Pr}\left[\mathrm{R}_{\mathrm{i}, \mathrm{j}}\right]$ ?

## Conclusion:

$\boldsymbol{R}_{i, j}$ happens if and only if: $i$ th or $j$ th ranked element is the first pivot out of $i$ th to $\boldsymbol{j}$ th ranked elements.

## How to analyze this?

Thinking acrobatics!
(1) Assign every element in the array a random priority (say in $[0,1]$ ).
(2) Choose pivot to be the element with lowest priority in subproblem.
(3) Equivalent to picking pivot uniformly at random (as QuickSort do).

## A Slick Analysis of QuickSort

Question: What is $\operatorname{Pr}\left[\mathrm{R}_{\mathrm{i}, \mathrm{j}}\right]$ ?

## How to analyze this?

Thinking acrobatics!
(1) Assign every element in the array a random priority (say in $[0,1]$ ).
(2) Choose pivot to be the element with lowest priority in subproblem.
$\Longrightarrow \boldsymbol{R}_{i, j}$ happens if either $\boldsymbol{i}$ or $\boldsymbol{j}$ have lowest priority out of elements rank $i$ to $\boldsymbol{j}$,
There are $k=j-i+1$ relevant elements

## A Slick Analysis of QuickSort

Question: What is $\operatorname{Pr}\left[\mathrm{R}_{\mathrm{i}, \mathrm{j}}\right]$ ?

## How to analyze this?

Thinking acrobatics!

(2) Choose pivot to be the element with lowest priority in subproblem.
$\Longrightarrow \boldsymbol{R}_{i, j}$ happens if either $\boldsymbol{i}$ or $\boldsymbol{j}$ have lowest priority out of elements rank $i$ to $j$,
There are $k=j-i+1$ relevant elements.

$$
\operatorname{Pr}\left[R_{i, j}\right]=\frac{2}{k}=\frac{2}{j-i+1} .
$$

## A Slick Analysis of QuickSort

Question: What is $\operatorname{Pr}\left[\boldsymbol{R}_{i j}\right]$ ?

## Lemma

$\operatorname{Pr}\left[R_{i j}\right]=\frac{2}{j-i+1}$

## Proof

Let $a_{1}, \ldots, a_{i}, \ldots, a_{j}, \ldots, a_{n}$ be elements of $A$ in sorted order
Let $S=\left\{a_{i}, a_{i+1}, \ldots, a_{j}\right\}$
Observation: If pivot is chosen outside $S$ then all of $S$ either in left array or right array.
Observation: $a_{i}$ and $a_{j}$ separated when a pivot is chosen from $S$ for the first time. Once separated no comparison.
Observation: $a_{i}$ is compared with $a_{j}$ if and only if either $a_{i}$ or $a_{j}$ is chosen as a pivot from $S$ at separation.

## A Slick Analysis of QuickSort

Question: What is $\operatorname{Pr}\left[\boldsymbol{R}_{i j}\right]$ ?
Lemma
$\operatorname{Pr}\left[\boldsymbol{R}_{i j}\right]=\frac{2}{j-i+1}$.

## Proof.

Let $a_{1}, \ldots, a_{i}, \ldots, a_{j}, \ldots, a_{n}$ be elements of $\boldsymbol{A}$ in sorted order. Let $S=\left\{a_{i}, a_{i+1}, \ldots, a_{j}\right\}$
Observation: If pivot is chosen outside $S$ then all of $S$ either in left array or right array.
Observation: $\boldsymbol{a}_{\boldsymbol{i}}$ and $\boldsymbol{a}_{\boldsymbol{j}}$ separated when a pivot is chosen from $\boldsymbol{S}$ for the first time. Once separated no comparison.
Observation: $a_{i}$ is compared with $a_{j}$ if and only if either $a_{i}$ or $a_{j}$ is chosen as a pivot from $S$ at separation.

## A Slick Analysis of QuickSort

Question: What is $\operatorname{Pr}\left[\boldsymbol{R}_{i j}\right]$ ?
Lemma
$\operatorname{Pr}\left[R_{i j}\right]=\frac{2}{j-i+1}$.

## Proof.

Let $a_{1}, \ldots, a_{i}, \ldots, a_{j}, \ldots, a_{n}$ be elements of $\boldsymbol{A}$ in sorted order. Let $S=\left\{a_{i}, a_{i+1}, \ldots, a_{j}\right\}$

## 11.5: Quick Select

## 11.6: Randomized Selection

## Randomized Quick Selection

Input Unsorted array $\boldsymbol{A}$ of $\boldsymbol{n}$ integers, an integer $\boldsymbol{j}$.
Goal Find the $\boldsymbol{j}$ th smallest number in $\boldsymbol{A}$ (rank $\boldsymbol{j}$ number)

## Randomized Quick Selection

(1) Pick a pivot element uniformly at random from the array.
(2) Split array into 3 subarrays: those smaller than pivot, those larger than pivot, and the pivot itself.
(3) Return pivot if rank of pivot is $\boldsymbol{j}$.
(4) Otherwise recurse on one of the arrays depending on $j$ and their sizes.

## Algorithm for Randomized Selection

Assume for simplicity that $\boldsymbol{A}$ has distinct elements.
QuickSelect ( $\boldsymbol{A}, \boldsymbol{j}$ ):
Pick pivot $\boldsymbol{x}$ uniformly at random from $\boldsymbol{A}$
Partition $\boldsymbol{A}$ into $\boldsymbol{A}_{\text {less }}, \boldsymbol{x}$, and $\boldsymbol{A}_{\text {greater }}$ using $\boldsymbol{x}$ as piv
if $\left(\left|A_{\text {less }}\right|=j-1\right)$ then
return $x$
if $\left(\left|A_{\text {less }}\right| \geq j\right)$ then
return QuickSelect ( $\left.A_{\text {less }}, j\right)$
else
return QuickSelect ( $A_{\text {greater }}, j-\left|A_{\text {less }}\right|-1$ )

## QuickSelect analysis

(1) $S_{1}, S_{2}, \ldots, S_{k}$ be the subproblems considered by the algorithm. Here $\left|S_{1}\right|=n$.
(2) $S_{i}$ would be successful if $\left|S_{i}\right| \leq(3 / 4)\left|S_{i-1}\right|$
(3) $Y_{1}=$ number of recursive calls till first successful iteration. Clearly, total work till this happens is $O\left(Y_{1} n\right)$.
(4) $\boldsymbol{n}_{\boldsymbol{i}}=$ size of the subproblem immediately after the $(\boldsymbol{i}-1)$ th successful iteration.
(5) $Y_{i}=$ number of recursive calls after the $(i-1)$ th successful call, till the $i$ th successful iteration.
(6) Running time is $\boldsymbol{O}\left(\sum_{i} \boldsymbol{n}_{\boldsymbol{i}} \boldsymbol{Y}_{i}\right)$.

## QuickSelect analysis

## Example

$S_{i}=$ subarray used in $i$ th recursive call
$\left|S_{i}\right|=$ size of this subarray
Red indicates successful iteration.

| Inst' | $S_{1}$ | $S_{2}$ | $S_{3}$ | $S_{4}$ | $S_{5}$ | $S_{6}$ | $S_{7}$ | $S_{8}$ | $S_{9}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\left\|S_{i}\right\|$ | 100 | 70 | 60 | 50 | 40 | 30 | 25 | 5 | 2 |
| Succ' $^{\prime}$ | $Y_{1}=2$ | $Y_{2}=4$ |  |  |  |  |  | $Y_{3}=2$ | $Y_{4}=1$ |
| $n_{i}=$ | $n_{1}=100$ | $n_{2}=60$ |  |  |  |  |  | $n_{3}=25$ | $n_{4}=2$ |

(1) All the subproblems after $(i-1)$ th successful iteration till $i$ th successful iteration have sizal work: $O\left(\sum_{i} n_{i} \boldsymbol{Y}_{i}\right)$.

## QuickSelect analysis

## Example

$S_{i}=$ subarray used in $i$ th recursive call
$\left|S_{i}\right|=$ size of this subarray
Red indicates successful iteration.

| Inst' $^{\prime}$ | $S_{1}$ | $S_{2}$ | $S_{3}$ | $S_{4}$ | $S_{5}$ | $S_{6}$ | $S_{7}$ | $S_{8}$ | $S_{9}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\left\|S_{i}\right\|$ | 100 | 70 | 60 | 50 | 40 | 30 | 25 | 5 | 2 |
| Succ' $^{\prime}$ | $Y_{1}=2$ | $Y_{2}=4$ |  |  |  |  | $Y_{3}=2$ | $Y_{4}=1$ |  |
| $\boldsymbol{n}_{\boldsymbol{i}}=$ | $\boldsymbol{n}_{1}=100$ | $\boldsymbol{n}_{\mathbf{2}}=60$ |  |  |  | $\boldsymbol{n}_{3}=25$ | $\boldsymbol{n}_{\mathbf{4}}=2$ |  |  |

(1) All the subproblems after $(i-1)$ th successful iteration till $i$ th successful iteration have size $\leq \boldsymbol{n}_{\boldsymbol{i}}$.
(2) Total work: $O\left(\sum_{i} n_{i} \boldsymbol{Y}_{i}\right)$.

## QuickSelect analysis

Total work: $\boldsymbol{O}\left(\sum_{i} \boldsymbol{n}_{\boldsymbol{i}} \boldsymbol{Y}_{\boldsymbol{i}}\right)$. We have:
(1) $n_{i} \leq(3 / 4) n_{i-1} \leq(3 / 4)^{i-1} n$.
(2) $Y_{i}$ is a random variable with geometric distribution Probability of $Y_{i}=k$ is $1 / 2^{i}$.
(3) $\mathrm{E}\left[Y_{i}\right]=2$.

As such, expected work is proportional to

$$
\begin{aligned}
& \mathrm{E}\left[\sum_{i} n_{i} Y_{i}\right]=\sum_{i} \mathrm{E}\left[n_{i} Y_{i}\right] \leq \sum_{i} \mathrm{E}\left[(3 / 4)^{i-1} n Y_{i}\right] \\
& \quad=n \sum_{i}(3 / 4)^{i-1} \mathrm{E}\left[Y_{i}\right]=n \sum_{i=1}(3 / 4)^{i-1} 2 \leq 8 n
\end{aligned}
$$

## QuickSelect analysis

## Theorem <br> The expected running time of QuickSelect is $\boldsymbol{O}(\mathbf{n})$.
