Recurrences, Closest Pair and Selection

Lecture 6
February 3, 2011
Part I

Recurrences
Solving Recurrences

Two general methods:

- Recursion tree method: need to do sums
  - elementary methods, geometric series
  - integration

- Guess and Verify
  - guessing involves intuition, experience and trial & error
  - verification is via induction
Consider $T(n) = 2T(n/2) + n/\log n$.

Construct recursion tree, and observe pattern. $i$th level has $2^i$ nodes, and problem size at each node is $n/2^i$ and hence work at each node is $n/2^i/\log n/2^i$.

Summing over all levels

$$T(n) = \sum_{i=0}^{\log n-1} 2^i \left[ \frac{(n/2^i)}{\log(n/2^i)} \right] = \sum_{i=0}^{\log n-1} \frac{n}{\log n-i}$$

$$= n \sum_{j=1}^{\log n} \frac{1}{j} = nH_{\log n} = \Theta(n \log \log n)$$
Consider $T(n) = 2T(n/2) + n/\log n$.

Construct recursion tree, and observe pattern. $i$th level has $2^i$ nodes, and problem size at each node is $n/2^i$ and hence work at each node is $n/2^i / \log \frac{n}{2^i}$.

Summing over all levels

$$T(n) = \sum_{i=0}^{\log n-1} 2^i \left[ \frac{(n/2^i)}{\log(n/2^i)} \right] = \sum_{i=0}^{\log n-1} \frac{n}{\log n - i}$$

$$= n \sum_{j=1}^{\log n} \frac{1}{j} = nH_{\log n} = \Theta(n \log \log n)$$
Consider \( T(n) = 2T(n/2) + n/\log n \).

Construct recursion tree, and observe pattern. \( i \)th level has \( 2^i \) nodes, and problem size at each node is \( n/2^i \) and hence work at each node is \( n \cdot 2^i / \log \frac{n}{2^i} \).

Summing over all levels

\[
T(n) = \sum_{i=0}^{\log n - 1} 2^i \left[ \frac{(n/2^i)}{\log(n/2^i)} \right] = \sum_{i=0}^{\log n - 1} \frac{n}{\log n - i} \\
= n \sum_{j=1}^{\log n} \frac{1}{j} = nH_{\log n} = \Theta(n \log \log n)
\]
Consider $T(n) = 2T(n/2) + n/\log n$.

Construct recursion tree, and observe pattern. $i$th level has $2^i$ nodes, and problem size at each node is $n/2^i$ and hence work at each node is $n/2^i / \log n/2^i$.

Summing over all levels

$$T(n) = \sum_{i=0}^{\log n - 1} 2^i \left[ \frac{n/2^i}{\log(n/2^i)} \right] = \sum_{i=0}^{\log n - 1} \frac{n}{\log n - i}$$

$$= n \sum_{j=1}^{\log n} \frac{1}{j} = nH_{\log n} = \Theta(n \log \log n)$$
Consider $T(n) = T(\sqrt{n}) + 1$.

What is the depth of recursion?

$\sqrt{n}$, $\sqrt[3]{n}$, $\sqrt[4]{n}$, ..., $O(1)$

Number of levels: $n^{2^{-L}} = 2$ means $L = \log \log n$

Number of children at each level is 1, work at each node is 1

Thus, $T(n) = \sum_{i=0}^{L} 1 = \Theta(L) = \Theta(\log \log n)$. 
Consider $T(n) = T(\sqrt{n}) + 1$.

What is the depth of recursion?

$\sqrt{n}, \sqrt{\sqrt{n}}, \sqrt[3]{\sqrt{n}}, \ldots, O(1)$

Number of levels: $n^{2^{-L}} = 2$ means $L = \log \log n$

Number of children at each level is 1, work at each node is 1

Thus, $T(n) = \sum_{i=0}^{L} 1 = \Theta(L) = \Theta(\log \log n)$. 
Consider $T(n) = T(\sqrt{n}) + 1$.

What is the depth of recursion?

$\sqrt{n}, \sqrt{\sqrt{n}}, \sqrt{\sqrt{\sqrt{n}}}, \ldots, O(1)$

Number of levels: $n^{2^{-L}} = 2$ means $L = \log \log n$

Number of children at each level is 1, work at each node is 1

Thus, $T(n) = \sum_{i=0}^{L} 1 = \Theta(L) = \Theta(\log \log n)$. 
Consider $T(n) = T(\sqrt{n}) + 1$.

What is the depth of recursion?

$\sqrt{n}, \sqrt[3]{n}, \sqrt[4]{n}, \ldots, O(1)$

Number of levels: $n^{2^{-L}} = 2$ means $L = \log \log n$

Number of children at each level is 1, work at each node is 1

Thus, $T(n) = \sum_{i=0}^{L} 1 = \Theta(L) = \Theta(\log \log n)$. 
Recurrence: Example II

- Consider $T(n) = T(\sqrt{n}) + 1$.
- What is the depth of recursion?
  
  $\sqrt{n}, \sqrt[4]{n}, \sqrt[8]{n}, \ldots, O(1)$

- Number of levels: $n^{2-L} = 2$ means $L = \log \log n$
- Number of children at each level is 1, work at each node is 1
- Thus, $T(n) = \sum_{i=0}^{L} 1 = \Theta(L) = \Theta(\log \log n)$. 
Consider $T(n) = \sqrt{n}T(\sqrt{n}) + n$.

Using recursion trees: number of levels $L = \log \log n$.

Work at each level? Root is $n$, next level is $\sqrt{n} \times \sqrt{n} = n$, so on. Can check that each level is $n$.

Thus, $T(n) = \Theta(n \log \log n)$.
Consider $T(n) = \sqrt{n}T(\sqrt{n}) + n$.

Using recursion trees: number of levels $L = \log \log n$

Work at each level? Root is $n$, next level is $\sqrt{n} \times \sqrt{n} = n$, so on. Can check that each level is $n$.

Thus, $T(n) = \Theta(n \log \log n)$
Consider $T(n) = \sqrt{n}T(\sqrt{n}) + n$.

Using recursion trees: number of levels $L = \log \log n$

Work at each level? Root is $n$, next level is $\sqrt{n} \times \sqrt{n} = n$, so on. Can check that each level is $n$.

Thus, $T(n) = \Theta(n \log \log n)$
Consider $T(n) = \sqrt{n}T(\sqrt{n}) + n$.

Using recursion trees: number of levels $L = \log \log n$.

Work at each level? Root is $n$, next level is $\sqrt{n} \times \sqrt{n} = n$, so on. Can check that each level is $n$.

Thus, $T(n) = \Theta(n \log \log n)$.
Consider $T(n) = T(n/4) + T(3n/4) + n$.

Using recursion tree, we observe the tree has leaves at different levels (a lop-sided tree).

Total work in any level is at most $n$. Total work in any level without leaves is exactly $n$.

Highest leaf is at level $\log_4 n$ and lowest leaf is at level $\log_{4/3} n$.

Thus, $n \log_4 n \leq T(n) \leq n \log_{4/3} n$, which means $T(n) = \Theta(n \log n)$.
Consider $T(n) = T(n/4) + T(3n/4) + n$.

Using recursion tree, we observe the tree has leaves at different levels (a *lop-sided* tree).

- Total work in any level is at most $n$. Total work in any level without leaves is exactly $n$.
- Highest leaf is at level $\log_4 n$ and lowest leaf is at level $\log_{4/3} n$.
- Thus, $n \log_4 n \leq T(n) \leq n \log_{4/3} n$, which means $T(n) = \Theta(n \log n)$. 

Consider $T(n) = T(n/4) + T(3n/4) + n$.

Using recursion tree, we observe the tree has leaves at different levels (a lop-sided tree).

Total work in any level is at most $n$. Total work in any level without leaves is exactly $n$.

Highest leaf is at level $\log_4 n$ and lowest leaf is at level $\log_{4/3} n$.

Thus, $n \log_4 n \leq T(n) \leq n \log_{4/3} n$, which means $T(n) = \Theta(n \log n)$.
Consider $T(n) = T(n/4) + T(3n/4) + n$.

Using recursion tree, we observe the tree has leaves at different levels (a *lop-sided* tree).

Total work in any level is at most $n$. Total work in any level without leaves is exactly $n$.

Highest leaf is at level $\log_4 n$ and lowest leaf is at level $\log_{4/3} n$.

Thus, $n \log_4 n \leq T(n) \leq n \log_{4/3} n$, which means $T(n) = \Theta(n \log n)$.
Consider $T(n) = T(n/4) + T(3n/4) + n$.

Using recursion tree, we observe the tree has leaves at different levels (a *lop-sided* tree).

Total work in any level is at most $n$. Total work in any level without leaves is exactly $n$.

Highest leaf is at level $\log_4 n$ and lowest leaf is at level $\log_{4/3} n$.

Thus, $n \log_4 n \leq T(n) \leq n \log_{4/3} n$, which means $T(n) = \Theta(n \log n)$.
Part II

Closest Pair
Closest Pair - the problem

**Input**  Given a set $S$ of $n$ points on the plane

**Goal**  Find $p, q \in S$ such that $d(p, q)$ is minimum
Closest Pair - the problem

Input: Given a set $S$ of $n$ points on the plane

Goal: Find $p, q \in S$ such that $d(p, q)$ is minimum
Applications

- Basic primitive used in graphics, vision, molecular modelling
- Ideas used in solving nearest neighbor, Voronoi diagrams, Euclidean MST
Algorithm: Brute Force

- Compute distance between every pair of points and find minimum
- Takes $O(n^2)$ time
- Can we do better?
Algorithm: Brute Force

- Compute distance between every pair of points and find minimum
- Takes $O(n^2)$ time
- Can we do better?
Algorithm: Brute Force

- Compute distance between every pair of points and find minimum
- Takes $O(n^2)$ time
- Can we do better?
**Closest Pair: 1-d case**

**Input**  Given a set $S$ of $n$ points on a line

**Goal**  Find $p, q \in S$ such that $d(p, q)$ is minimum

**Algorithm**

1. Sort points based on coordinate
2. Compute the distance between successive points, keeping track of the closest pair.

**Running time** $O(n \log n)$

Can we do this in better running time?
Can reduce Distinct Elements Problem (see lecture 1) to this problem in $O(n)$ time. Do you see how?
Closest Pair: 1-d case

**Input**  Given a set $S$ of $n$ points on a line

**Goal**  Find $p, q \in S$ such that $d(p, q)$ is minimum

### Algorithm

1. Sort points based on coordinate
2. Compute the distance between successive points, keeping track of the closest pair.

**Running time** $O(n \log n)$

Can we do this in better running time? Can reduce Distinct Elements Problem (see lecture 1) to this problem in $O(n)$ time. Do you see how?
Generalizing 1-d case

Can we generalize 1-d algorithm to 2-d?
Sort according to $x$ or $y$-coordinate??

No easy generalization.
Generalizing 1-d case

Can we generalize 1-d algorithm to 2-d? Sort according to x or y-coordinate? No easy generalization.
First Attempt

Divide and Conquer I

1. Partition into 4 quadrants of roughly equal size.  Not always!
2. Find closest pair in each quadrant recursively
3. Combine solutions
First Attempt

Divide and Conquer I

1. Partition into 4 quadrants of roughly equal size. Not always!
2. Find closest pair in each quadrant recursively
3. Combine solutions
New Algorithm

Divide and Conquer II

1. Divide the set of points into two equal parts via vertical line
2. Find closest pair in each half recursively
3. Find closest pair with one point in each half
4. Return the best pair among the above 3 solutions
New Algorithm

Divide and Conquer II

1. Divide the set of points into two equal parts via vertical line
2. Find closest pair in each half recursively
3. Find closest pair with one point in each half
4. Return the best pair among the above 3 solutions
New Algorithm

Divide and Conquer II

1. Divide the set of points into two equal parts via vertical line
2. Find closest pair in each half recursively
3. Find closest pair with one point in each half
4. Return the best pair among the above 3 solutions
New Algorithm

Divide and Conquer II

1. Divide the set of points into two equal parts via vertical line
2. Find closest pair in each half recursively
3. Find closest pair with one point in each half
4. Return the best pair among the above 3 solutions
New Algorithm

Divide and Conquer II

1. Divide the set of points into two equal parts via vertical line
2. Find closest pair in each half recursively
3. Find closest pair with one point in each half
4. Return the best pair among the above 3 solutions

- Sort points based on $x$-coordinate and pick the median. Time $= O(n \log n)$
- How to find closest pair with points in different halves? $O(n^2)$ is trivial. Better?
New Algorithm

**Divide and Conquer II**

1. Divide the set of points into two equal parts via vertical line.
2. Find closest pair in each half recursively.
3. Find closest pair with one point in each half.
4. Return the best pair among the above 3 solutions.

- Sort points based on $x$-coordinate and pick the median. Time $= O(n \log n)$.
- How to find closest pair with points in different halves? $O(n^2)$ is trivial. Better?
New Algorithm

Divide and Conquer II

1. Divide the set of points into two equal parts via vertical line
2. Find closest pair in each half recursively
3. Find closest pair with one point in each half
4. Return the best pair among the above 3 solutions

- Sort points based on $x$-coordinate and pick the median. Time $= O(n \log n)$
- How to find closest pair with points in different halves? $O(n^2)$ is trivial. Better?
New Algorithm

## Divide and Conquer II

1. Divide the set of points into two equal parts via vertical line
2. Find closest pair in each half recursively
3. Find closest pair with one point in each half
4. Return the best pair among the above 3 solutions

- Sort points based on x-coordinate and pick the median. Time $= O(n \log n)$
- How to find closest pair with points in different halves? $O(n^2)$ is trivial. Better?
New Algorithm

Divide and Conquer II

1. Divide the set of points into two equal parts via vertical line
2. Find closest pair in each half recursively
3. Find closest pair with one point in each half
4. Return the best pair among the above 3 solutions

- Sort points based on \(x\)-coordinate and pick the median. Time \(= O(n \log n)\)
- How to find closest pair with points in different halves? \(O(n^2)\) is trivial. Better?
Combining Partial Solutions

- Does it take $O(n^2)$ to combine solutions?
- Let $\delta$ be the distance between closest pairs, where both points belong to the same half.
Combining Partial Solutions

- Let $\delta$ be the distance between closest pairs, where both points belong to the same half.
- Need to consider points within $\delta$ of dividing line.
Sparsity of Band

Divide the band into square boxes of size $\frac{\delta}{2}$

Lemma

Each box has at most one point

Proof.

If not, then there are a pair of points (both belonging to one half) that are at most $\sqrt{2}\frac{\delta}{2} < \delta$ apart!
Divide the band into square boxes of size $\delta/2$

**Lemma**

*Each box has at most one point*

**Proof.**

If not, then there are a pair of points (both belonging to one half) that are at most $\sqrt{2}\delta/2 < \delta$ apart!
Divide the band into square boxes of size $\delta/2$

**Lemma**

*Each box has at most one point*

**Proof.**

If not, then there are a pair of points (both belonging to one half) that are at most $\sqrt{2}\delta/2 < \delta$ apart!
Lemma

Suppose $a, b$ are at distance less than $\delta$ in the band. Then $a, b$ have at most two rows of boxes between them.

Proof.

Each row of boxes has height $\delta/2$. If more than two rows then distance between $a, b$ greater than $\delta$. 
Lemma
Suppose \( a, b \) are at distance less than \( \delta \) in the band. Then \( a, b \) have at most two rows of boxes between them.

Proof.
Each row of boxes has height \( \delta/2 \). If more than two rows then distance between \( a, b \) greater than \( \delta \).
Searching within the Band

**Corollary**

Order points according to their $y$-coordinate. If $p, q$ are such that $d(p, q) < \delta$ then $p$ and $q$ are within 12 positions in the sorted list.

**Proof.**

- Suppose not. Let $p$ and $q$ have at least 11 points between them in the sorted order.
- $p$ and $q$ are at least two rows apart in grid because each box has at most one point.
- $d(p, q) > 2(\delta/2) = \delta$!
Corollary

Order points according to their $y$-coordinate. If $p, q$ are such that $d(p, q) < \delta$ then $p$ and $q$ are within 12 positions in the sorted list.

Proof.

- Suppose not. Let $p$ and $q$ have at least 11 points between them in the sorted order.
- $p$ and $q$ are at least two rows apart in grid because each box has at most one point.
- $d(p, q) > 2(\delta/2) = \delta!$
Corollary

Order points according to their \(y\)-coordinate. If \(p, q\) are such that \(d(p, q) < \delta\) then \(p\) and \(q\) are within 12 positions in the sorted list.

Proof.

- Suppose not. Let \(p\) and \(q\) have at least 11 points between them in the sorted order.
- \(p\) and \(q\) are at least two rows apart in grid because each box has at most one point.
- \(d(p, q) > 2(\delta/2) = \delta\)!
Corollary

Order points according to their $y$-coordinate. If $p, q$ are such that $d(p, q) < \delta$ then $p$ and $q$ are within 12 positions in the sorted list.

Proof.

- Suppose not. Let $p$ and $q$ have at least 11 points between them in the sorted order.
- $p$ and $q$ are at least two rows apart in grid because each box has at most one point.
- $d(p, q) > 2(\delta/2) = \delta!$
The Algorithm

1. Find vertical line $L$ that splits the points into equal halves
2. Compute closest pair in the left half; let the distance be $\delta_1$
3. Compute closest pair in right half; let the distance be $\delta_2$
4. $\delta = \min(\delta_1, \delta_2)$
5. Delete points further than $\delta$ from $L$
6. Sort remaining points based on $y$-coordinate into an array $A$
7. for $i = 1$ to $|A| - 1$ do
   for $j = i + 1$ to $\min\{i + 11, |A|\}$ do
      If ($\text{dist}(A[i], A[j]) < \delta$) update $\delta$ and closest pair

- Step 1, involves sorting and scanning. Takes $O(n \log n)$ time.
- Step 5 takes $O(n)$ time
- Step 6 takes $O(n \log n)$ time
- Step 7 takes $O(n)$ time
The Algorithm

1. Find vertical line \( L \) that splits the points into equal halves
2. Compute closest pair in the left half; let the distance be \( \delta_1 \)
3. Compute closest pair in right half; let the distance be \( \delta_2 \)
4. \( \delta = \min(\delta_1, \delta_2) \)
5. Delete points further than \( \delta \) from \( L \)
6. Sort remaining points based on \( y \)-coordinate into an array \( A \)
7. for \( i = 1 \) to \( |A| - 1 \) do
   for \( j = i + 1 \) to \( \min\{i + 11, |A|\} \) do
     If \( \text{dist}(A[i], A[j]) < \delta \) update \( \delta \) and closest pair

- Step 1, involves sorting and scanning. Takes \( O(n \log n) \) time.
- Step 5 takes \( O(n) \) time
- Step 6 takes \( O(n \log n) \) time
- Step 7 takes \( O(n) \) time
The Algorithm

1. Find vertical line $L$ that splits the points into equal halves
2. Compute closest pair in the left half; let the distance be $\delta_1$
3. Compute closest pair in right half; let the distance be $\delta_2$
4. $\delta = \min(\delta_1, \delta_2)$
5. Delete points further than $\delta$ from $L$
6. Sort remaining points based on $y$-coordinate into an array $A$
7. for $i = 1$ to $|A| - 1$ do
   for $j = i + 1$ to $\min\{i + 11, |A|\}$ do
     If ($\operatorname{dist}(A[i], A[j]) < \delta$) update $\delta$ and closest pair

- Step 1, involves sorting and scanning. Takes $O(n \log n)$ time.
- Step 5 takes $O(n)$ time
- Step 6 takes $O(n \log n)$ time
- Step 7 takes $O(n)$ time
The Algorithm

1. Find vertical line $L$ that splits the points into equal halves
2. Compute closest pair in the left half; let the distance be $\delta_1$
3. Compute closest pair in right half; let the distance be $\delta_2$
4. $\delta = \min(\delta_1, \delta_2)$
5. Delete points further than $\delta$ from $L$
6. Sort remaining points based on $y$-coordinate into an array $A$
7. for $i = 1$ to $|A| - 1$ do
   for $j = i + 1$ to $\min\{i + 11, |A|\}$ do
      If $(\text{dist}(A[i], A[j]) < \delta)$ update $\delta$ and closest pair

- Step 1, involves sorting and scanning. Takes $O(n \log n)$ time.
- Step 5 takes $O(n)$ time
- Step 6 takes $O(n \log n)$ time
- Step 7 takes $O(n)$ time
The Algorithm

1. Find vertical line $L$ that splits the points into equal halves
2. Compute closest pair in the left half; let the distance be $\delta_1$
3. Compute closest pair in right half; let the distance be $\delta_2$
4. $\delta = \min(\delta_1, \delta_2)$
5. Delete points further than $\delta$ from $L$
6. Sort remaining points based on $y$-coordinate into an array $A$
7. for $i = 1$ to $|A| - 1$ do
   for $j = i + 1$ to $\min\{i + 11, |A|\}$ do
      If $(\text{dist}(A[i], A[j]) < \delta)$ update $\delta$ and closest pair

- Step 1, involves sorting and scanning. Takes $O(n \log n)$ time.
- Step 5 takes $O(n)$ time
- Step 6 takes $O(n \log n)$ time
- Step 7 takes $O(n)$ time
The Algorithm

1. Find vertical line $L$ that splits the points into equal halves
2. Compute closest pair in the left half; let the distance be $\delta_1$
3. Compute closest pair in right half; let the distance be $\delta_2$
4. $\delta = \min(\delta_1, \delta_2)$
5. Delete points further than $\delta$ from $L$
6. Sort remaining points based on $y$-coordinate into an array $A$
7. for $i = 1$ to $|A| - 1$ do
   for $j = i + 1$ to $\min\{i + 11, |A|\}$ do
     If $(\text{dist}(A[i], A[j]) < \delta)$ update $\delta$ and closest pair

- Step 1, involves sorting and scanning. Takes $O(n \log n)$ time.
- Step 5 takes $O(n)$ time
- Step 6 takes $O(n \log n)$ time

   for $j = i + 1$ to $\min\{i + 11, |A|\}$ do
      If $(\text{dist}(A[i], A[j]) < \delta)$ update $\delta$ and closest pair

- Step 1, involves sorting and scanning. Takes $O(n \log n)$ time.
- Step 5 takes $O(n)$ time
- Step 6 takes $O(n \log n)$ time
- Step 7 takes $O(n)$ time
The Algorithm

1. Find vertical line $L$ that splits the points into equal halves
2. Compute closest pair in the left half; let the distance be $\delta_1$
3. Compute closest pair in right half; let the distance be $\delta_2$
4. $\delta = \min(\delta_1, \delta_2)$
5. Delete points further than $\delta$ from $L$
6. Sort remaining points based on $y$-coordinate into an array $A$
7. for $i = 1$ to $|A| - 1$ do
   for $j = i + 1$ to $\min\{i + 11, |A|\}$ do
      If ($\text{dist}(A[i], A[j]) < \delta$) update $\delta$ and closest pair

- Step 1, involves sorting and scanning. Takes $O(n \log n)$ time.
- Step 5 takes $O(n)$ time
- Step 6 takes $O(n \log n)$ time
- Step 7 takes $O(n)$ time
The running time of the algorithm is given by

$$T(n) \leq 2T(n/2) + O(n \log n)$$

Thus, $T(n) = O(n \log^2 n)$.

**Improved Algorithm**

Avoid repeated sorting of points in band: two options

- Sort all points by $y$-coordinate and store the list. In conquer step use this to avoid sorting
- Each recursive call returns a list of points sorted by their $y$-coordinates. Merge in conquer step in linear time.

Analysis: $T(n) \leq 2T(n/2) + O(n) = O(n \log n)$
Running Time

The running time of the algorithm is given by

\[ T(n) \leq 2T(n/2) + O(n \log n) \]

Thus, \( T(n) = O(n \log^2 n) \).

Improved Algorithm

Avoid repeated sorting of points in band: two options

- Sort all points by y-coordinate and store the list. In conquer step use this to avoid sorting
- Each recursive call returns a list of points sorted by their y-coordinates. Merge in conquer step in linear time.

Running Time

The running time of the algorithm is given by

$$T(n) \leq 2T(n/2) + O(n \log n)$$

Thus, $$T(n) = O(n \log^2 n).$$

Improved Algorithm

Avoid repeated sorting of points in band: two options

- Sort all points by \(y\)-coordinate and store the list. In conquer step use this to avoid sorting
- Each recursive call returns a list of points sorted by their \(y\)-coordinates. Merge in conquer step in linear time.

Analysis: $$T(n) \leq 2T(n/2) + O(n) = O(n \log n)$$
Part III

Selecting in Unsorted Lists
Quick Sort

Quick Sort [Hoare]

1. Pick a pivot element from array
2. Split array into 3 subarrays: those smaller than pivot, those larger than pivot, and the pivot itself. Linear scan of array does it. Time is $O(n)$
3. Recursively sort the subarrays, and concatenate them.

Example:
- array: 16, 12, 14, 20, 5, 3, 18, 19, 1
- pivot: 16
- split into 12, 14, 5, 3, 1 and 20, 19, 18 and recursively sort
- put them together with pivot in middle
Quick Sort

**Quick Sort [Hoare]**

1. Pick a pivot element from array
2. Split array into 3 subarrays: those smaller than pivot, those larger than pivot, and the pivot itself. Linear scan of array does it. Time is $O(n)$
3. Recursively sort the subarrays, and concatenate them.

**Example:**
- array: 16, 12, 14, 20, 5, 3, 18, 19, 1
- pivot: 16
- split into 12, 14, 5, 3, 1 and 20, 19, 18 and recursively sort
- put them together with pivot in middle

Let $k$ be the rank of the chosen pivot. Then,

$$T(n) = T(k-1) + T(n-k) + O(n)$$

If $k = \lceil n/2 \rceil$ then

$$T(n) = T(\lceil n/2 \rceil - 1) + T(\lfloor n/2 \rfloor) + O(n) \leq 2T(n/2) + O(n).$$

Then, $T(n) = O(n \log n)$.

Theoretically, median can be found in linear time.

Typically, pivot is the first or last element of array. Then,

$$T(n) = \max_{1 \leq k \leq n} (T(k-1) + T(n-k) + O(n))$$

In the worst case $T(n) = T(n - 1) + O(n)$, which means $T(n) = O(n^2)$. Happens if array is already sorted and pivot is always first element.
Let $k$ be the rank of the chosen pivot. Then,

$$T(n) = T(k - 1) + T(n - k) + O(n)$$

If $k = \lceil n/2 \rceil$ then

$$T(n) = T(\lceil n/2 \rceil - 1) + T(\lfloor n/2 \rfloor) + O(n) \leq 2T(n/2) + O(n).$$

Then, $T(n) = O(n \log n)$.

- Theoretically, median can be found in linear time.
- Typically, pivot is the first or last element of array. Then,

$$T(n) = \max_{1 \leq k \leq n} (T(k - 1) + T(n - k) + O(n))$$

In the worst case $T(n) = T(n - 1) + O(n)$, which means $T(n) = O(n^2)$. Happens if array is already sorted and pivot is always first element.
Time Analysis

- Let $k$ be the rank of the chosen pivot. Then,
  $$T(n) = T(k - 1) + T(n - k) + O(n)$$

- If $k = \lceil n/2 \rceil$ then
  $$T(n) = T(\lceil n/2 \rceil - 1) + T(\lfloor n/2 \rfloor) + O(n) \leq 2T(n/2) + O(n).$$
  Then, $T(n) = O(n \log n)$.

  Theoretically, median can be found in linear time.

- Typically, pivot is the first or last element of array. Then,
  $$T(n) = \max_{1 \leq k \leq n} (T(k - 1) + T(n - k) + O(n))$$

In the worst case $T(n) = T(n - 1) + O(n)$, which means $T(n) = O(n^2)$. Happens if array is already sorted and pivot is always first element.
Time Analysis

- Let \( k \) be the rank of the chosen pivot. Then,
  \[
  T(n) = T(k - 1) + T(n - k) + O(n)
  \]

- If \( k = \lceil n/2 \rceil \) then
  \[
  T(n) = T(\lceil n/2 \rceil - 1) + T(\lfloor n/2 \rfloor) + O(n) \leq 2T(n/2) + O(n).
  \]
  Then, \( T(n) = O(n \log n) \).

- Theoretically, median can be found in linear time.

- Typically, pivot is the first or last element of array. Then,

  \[
  T(n) = \max_{1 \leq k \leq n} (T(k - 1) + T(n - k) + O(n))
  \]

In the worst case \( T(n) = T(n - 1) + O(n) \), which means \( T(n) = O(n^2) \). Happens if array is already sorted and pivot is always first element.
Problem - Selection

Input  Unsorted array $A$ of $n$ integers
Goal   Find the $j$’th smallest number in $A$ (rank $j$ number)

Example

$A = \{4, 6, 2, 1, 5, 8, 7\}$ and $j = 4$. The $j$th smallest element is 5.

Median: $j = \lceil (n + 1)/2 \rceil$
Algorithm I

1. Sort the elements in $A$
2. Pick $j$th element in sorted order

Time taken = $O(n \log n)$

Do we need to sort? Is there an $O(n)$ time algorithm?
Algorithm 1

1. Sort the elements in \( A \)
2. Pick the \( j \)th element in sorted order

Time taken = \( O(n \log n) \)

Do we need to sort? Is there an \( O(n) \) time algorithm?
Algorithm II

If $j$ is small or $n - j$ is small then

- Find $j$ smallest/largest elements in $A$ in $O(jn)$ time. (How?)
- Time to find median is $O(n^2)$. 
Divide and Conquer Approach

1. Pick a pivot element $a$ from $A$

2. Partition $A$ based on $a$.
   - $A_{\text{less}} = \{x \in A \mid x \leq a\}$ and $A_{\text{greater}} = \{x \in A \mid x > a\}$

3. $|A_{\text{less}}| = j$: return $a$

4. $|A_{\text{less}}| > j$: recursively find $j$th smallest element in $A_{\text{less}}$

5. $|A_{\text{less}}| < j$: recursively find $k$th smallest element in $A_{\text{greater}}$
   where $k = j - |A_{\text{less}}|$.
Time Analysis

- Partitioning step: $O(n)$ time to scan $A$
- How do we choose pivot? Recursive running time?

Suppose we always choose pivot to be $A[1]$.

Say $A$ is sorted in increasing order and $j = n$.
Exercise: show that algorithm takes $\Omega(n^2)$ time
Time Analysis

- How do we choose pivot? Recursive running time?

Suppose we always choose pivot to be $A[1]$.

Say $A$ is sorted in increasing order and $j = n$. Exercise: show that algorithm takes $\Omega(n^2)$ time.
A Better Pivot

Suppose pivot is the $\ell$'th smallest element where $n/4 \leq \ell \leq 3n/4$. That is pivot is *approximately* in the middle of $A$.

Then $n/4 \leq |A_{\text{less}}| \leq 3n/4$ and $n/4 \leq |A_{\text{greater}}| \leq 3n/4$. If we apply recursion,

$$T(n) \leq T(3n/4) + O(n)$$

Implies $T(n) = O(n)$!

How do we find such a pivot? Randomly? In fact works! Analysis a little bit later.

Can we choose pivot deterministically?
A Better Pivot

Suppose pivot is the \( \ell \)'th smallest element where \( n/4 \leq \ell \leq 3n/4 \). That is pivot is *approximately* in the middle of \( A \). Then \( n/4 \leq |A_{\text{less}}| \leq 3n/4 \) and \( n/4 \leq |A_{\text{greater}}| \leq 3n/4 \). If we apply recursion,

\[
T(n) \leq T(3n/4) + O(n)
\]

Implies \( T(n) = O(n) \)!

How do we find such a pivot? Randomly? In fact works! Analysis a little bit later.

Can we choose pivot deterministically?
A Better Pivot

Suppose pivot is the \( \ell \)'th smallest element where \( n/4 \leq \ell \leq 3n/4 \). That is pivot is \textit{approximately} in the middle of \( A \). Then \( n/4 \leq |A_{\text{less}}| \leq 3n/4 \) and \( n/4 \leq |A_{\text{greater}}| \leq 3n/4 \). If we apply recursion,

\[
T(n) \leq T(3n/4) + O(n)
\]

Implies \( T(n) = O(n) \)!

How do we find such a pivot? Randomly? In fact works! Analysis a little bit later.

Can we choose pivot deterministically?
A Better Pivot

Suppose pivot is the $\ell'$th smallest element where $n/4 \leq \ell \leq 3n/4$. That is pivot is approximately in the middle of $A$.

Then $n/4 \leq |A_{\text{less}}| \leq 3n/4$ and $n/4 \leq |A_{\text{greater}}| \leq 3n/4$. If we apply recursion,

$$T(n) \leq T(3n/4) + O(n)$$

Implies $T(n) = O(n)$!

How do we find such a pivot? Randomly? In fact works!

Analysis a little bit later.

Can we choose pivot deterministically?

Implies $T(n) = O(n)$!

How do we find such a pivot? Randomly? In fact works!
Analysis a little bit later.

Can we choose pivot deterministically?
Choosing the pivot

1. Partition array $A$ into $\lceil n/5 \rceil$ lists of 5 items each.
   \[ L_1 = \{A[1], A[2], \ldots, A[5]\}, \quad L_2 = \{A[6], \ldots, A[10]\}, \quad \ldots, \quad L_i = \{A[5i + 1], \ldots, A[5i - 4]\}, \quad \ldots, \quad L_{\lceil n/5 \rceil} = \{A[5\lceil n/5 \rceil - 4], \ldots, A[n]\}. \]

2. For each $i$ find median $b_i$ of $L_i$ using brute-force in $O(1)$ time. Total $O(n)$ time.

3. Let $B = \{b_1, b_2, \ldots, b_{\lceil n/5 \rceil}\}$

4. Find median $b$ of $B$

Lemma

Median of $B$ is an approximate median of $A$. That is, if $b$ is used as pivot to partition $A$, then $|A_{\text{less}}| \leq 7n/10 + 6$ and $|A_{\text{greater}}| \leq 7n/10 + 6$. 
Choosing the pivot

1. Partition array $A$ into $\lceil n/5 \rceil$ lists of 5 items each.
   
   $L_1 = \{A[1], A[2], \ldots, A[5]\}$, $L_2 = \{A[6], \ldots, A[10]\}$, \ldots,
   
   $L_i = \{A[5i + 1], \ldots, A[5i - 4]\}$, \ldots,
   
   $L_{\lceil n/5 \rceil} = \{A[5\lceil n/5 \rceil - 4, \ldots, A[n]\}$.

2. For each $i$ find median $b_i$ of $L_i$ using brute-force in $O(1)$ time.
   Total $O(n)$ time

3. Let $B = \{b_1, b_2, \ldots, b_{\lceil n/5 \rceil}\}$

4. Find median $b$ of $B$

Lemma

Median of $B$ is an approximate median of $A$. That is, if $b$ is used a pivot to partition $A$, then $|A_{\text{less}}| \leq 7n/10 + 6$ and $|A_{\text{greater}}| \leq 7n/10 + 6$. 

Algorithm for Selection

\textbf{select}(A, j):

Form lists \( L_1, L_2, \ldots, L_{\lceil n/5 \rceil} \) where \( L_i = \{A[5i - 4], \ldots, A[5i]\} \)

Find median \( b_i \) of each \( L_i \) using brute-force

Find median \( b \) of \( B = \{b_1, b_2, \ldots, b_{\lceil n/5 \rceil}\} \)

Partition \( A \) into \( A_{\text{less}} \) and \( A_{\text{greater}} \) using \( b \) as pivot

If \( |A_{\text{less}}| = j \) return \( b \)

Else if \( |A_{\text{less}}| > j \)

\quad return \textbf{select}(A_{\text{less}}, j)

Else

\quad return \textbf{select}(A_{\text{greater}}, j - |A_{\text{less}}|)

How do we find median of \( B \)? Recursively!
Algorithm for Selection

\textbf{select}(A, j):

Form lists $L_1, L_2, \ldots, L_{\lceil n/5 \rceil}$ where $L_i = \{A[5i-4], \ldots, A[5i]\}$

Find median $b_i$ of each $L_i$ using brute-force

Find median $b$ of $B = \{b_1, b_2, \ldots, b_{\lceil n/5 \rceil}\}$

Partition $A$ into $A_{\text{less}}$ and $A_{\text{greater}}$ using $b$ as pivot

If ($|A_{\text{less}}| = j$) return $b$

Else if ($|A_{\text{less}}| > j$)

\hspace*{1cm} return \textbf{select}(A_{\text{less}}, j)

Else

\hspace*{1cm} return \textbf{select}(A_{\text{greater}}, j - |A_{\text{less}}|)

How do we find median of $B$? Recursively!

\text{Partition } A \text{ into } A_{\text{less or equal}} \text{ and } A_{\text{greater}} \text{ using } b \text{ as pivot} \\
\text{if } |A_{\text{less or equal}}| = j \text{ then} \\
\quad &\text{return } b \\
\text{if } |A_{\text{less or equal}}| > j \text{ then} \\
\quad &\text{return } \text{select}(A_{\text{less or equal}}, j) \\
\text{else} \\
\quad &\text{return } \text{select}(A_{\text{greater}}, j - |A_{\text{less or equal}}|) \\
\end{align*}
\]
Running time

\[ T(n) = T(\lceil n/5 \rceil) + \max \{ T(|A_{\text{less}}|), T(|A_{\text{greater}}|) \} + O(n) \]

From Lemma,

\[ T(n) \leq T(\lceil n/5 \rceil) + T(\lfloor 7n/10 + 6 \rfloor) + O(n) \]

and

\[ T(1) = 1 \]

Exercise: show that \( T(n) = O(n) \)
Running time

\[ T(n) = T(\lceil n/5 \rceil) + \max\{ T(|A_{\text{less}}|), T(|A_{\text{greater}}|) \} + O(n) \]

From Lemma,

\[ T(n) \leq T(\lceil n/5 \rceil) + T(\lceil 7n/10 + 6 \rceil) + O(n) \]

and

\[ T(1) = 1 \]

Exercise: show that \( T(n) = O(n) \)
Running time

\[
T(n) = T(\lceil n/5 \rceil) + \max\{T(|A_{\text{less}}|), T(|A_{\text{greater}}|)\} + O(n)
\]

From Lemma,

\[
T(n) \leq T(\lceil n/5 \rceil) + T(\lfloor 7n/10 + 6 \rfloor) + O(n)
\]

and

\[
T(1) = 1
\]

**Exercise:** show that \(T(n) = O(n)\)
**Proposition**

There are at least $\frac{3n}{10} - 6$ elements greater than the median of medians $b$.

**Proof.**

At least half of the $\lceil \frac{n}{5} \rceil$ groups have at least 3 elements larger than $b$, except for last group and the group containing $b$. So $b$ is less than

$$3(\lceil (1/2) \lceil n/5 \rceil \rceil - 2) \geq \frac{3n}{10} - 6$$
**Proposition**

There are at least \( \frac{3n}{10} - 6 \) elements greater than the median of medians \( b \).

**Proof.**

At least half of the \( \lceil \frac{n}{5} \rceil \) groups have at least 3 elements larger than \( b \), except for last group and the group containing \( b \). So \( b \) is less than

\[
3\left(\lceil \frac{1}{2} \lceil \frac{n}{5} \rceil \rceil - 2 \right) \geq \frac{3n}{10} - 6
\]
 Proposition

There are at least \( \frac{3n}{10} - 6 \) elements greater than the median of medians \( b \).

 Corollary

\[ |A_{\text{less}}| \leq \frac{7n}{10} + 6. \]

Via symmetric argument,

 Corollary

\[ |A_{\text{greater}}| \leq \frac{7n}{10} + 6. \]
Questions to ponder

- Why did we choose lists of size 5? Will lists of size 3 work?
- Write a recurrence to analyze the algorithm’s running time if we choose a list of size $k$. 
Median of Medians Algorithm

Due to:
“Time bounds for selection”.

How many Turing Award winners in the author list?
All except Vaughn Pratt!

Takeaway Points

- Recursion tree method and guess and verify are the most reliable methods to analyze recursions in algorithms.
- Recursive algorithms naturally lead to recurrences.
- Some times one can look for certain type of recursive algorithms (reverse engineering) by understanding recurrences and their behavior.
