Breadth First Search, Dijkstra’s Algorithm for Shortest Paths

Lecture 10
February 24, 2015
Part I

Breadth First Search
Overview

(A) **BFS** is obtained from **BasicSearch** by processing edges using a data structure called a **queue**.

(B) It processes the vertices in the graph in the order of their shortest distance from the vertex **s** (the start vertex).

As such...

1. **DFS** good for exploring graph structure
2. **BFS** good for exploring **distances**
PREPARING FOR A DATE:
WHAT SITUATIONS MIGHT I PREPARE FOR?
1) MEDICAL EMERGENCY
2) DANCING
3) FOOD TOO EXPENSIVE

OKAY, WHAT KINDS OF EMERGENCIES CAN HAPPEN?
1) SNAKEBITE
2) LIGHTNING STROKE
3) FALL FROM CHAIR

HMM, WHICH SNAKES ARE DANGEROUS? LET'S SEE...
1) CORN SNAKE
2) GARTER SNAKE
3) COPPERHEAD

THE RESEARCH COMPARING SNAKE VENOMS IS SCATTERED AND INCONSISTENT. I'LL MAKE A SPREADSHEET TO ORGANIZE IT.

I'M HERE TO PICK YOU UP. YOU'RE NOT DRESSED?

BY U3, THE INLAND TaIPAN HAS THE DEADIEST VENOM OF ANY SNAKE.

I REALLY NEED TO STOP USING DEPTH-FIRST SEARCHES.
Queue Data Structure

Queues

A **queue** is a list of elements which supports the operations:

1. **enqueue**: Adds an element to the end of the list
2. **dequeue**: Removes an element from the front of the list

Elements are extracted in **first-in first-out (FIFO)** order, i.e., elements are picked in the order in which they were inserted.
BFS Algorithm

Given (undirected or directed) graph $G = (V, E)$ and node $s \in V$

**BFS(s)**
- Mark all vertices as unvisited
- Initialize search tree $T$ to be empty
- Mark vertex $s$ as visited
- set $Q$ to be the empty queue

**enq(s)**

**while** $Q$ is nonempty **do**

$u = \text{deq}(Q)$

**for** each vertex $v \in \text{Adj}(u)$

**if** $v$ is not visited **then**

add edge $(u, v)$ to $T$
Mark $v$ as visited and **enq**(v)

**Proposition**

**BFS(s) runs in $O(n + m)$ time.**

BFS: An Example in Undirected Graphs

BFS tree is the set of black edges.
BFS: An Example in Directed Graphs

A directed graph (also called a digraph) is defined as $G = (V, E)$, where $V$ is a set of vertices or nodes and $E \subseteq V \times V$ is the set of ordered pairs of vertices called edges.

Viswanathan
BFS with Distance

**BFS(s)**
Mark all vertices as unvisited; for each v set \( \text{dist}(v) = \infty \)
Initialize search tree \( T \) to be empty
Mark vertex \( s \) as visited and set \( \text{dist}(s) = 0 \)
set \( Q \) to be the empty queue
enq(s)
while \( Q \) is nonempty do
  \( u = \text{deq}(Q) \)
  for each vertex \( v \in \text{Adj}(u) \) do
    if \( v \) is not visited do
      add edge \( (u,v) \) to \( T \)
      Mark \( v \) as visited, enq(v) and set \( \text{dist}(v) = \text{dist}(u) + 1 \)
Properties of BFS: Undirected Graphs

Proposition

The following properties hold upon termination of BFS(s)

(A) The search tree contains exactly the set of vertices in the connected component of s.

(B) If dist(u) < dist(v) then u is visited before v.

(C) For every vertex u, dist(u) is the length of a shortest path (in terms of edges) from s to u.

(D) If u, v are in connected component of s and e = {u, v} is an edge of G, then |dist(u) − dist(v)| ≤ 1.

Proof.

Exercise.
The following properties hold upon termination of BFS(s):

(A) The search tree contains exactly the set of vertices reachable from s

(B) If $\text{dist}(u) < \text{dist}(v)$ then u is visited before v

(C) For every vertex u, $\text{dist}(u)$ is indeed the length of shortest path from s to u

(D) If u is reachable from s and $e = (u, v)$ is an edge of G, then $\text{dist}(v) - \text{dist}(u) \leq 1$.

Not necessarily the case that $\text{dist}(u) - \text{dist}(v) \leq 1$. 
BFS with Layers

BFS\text{Layers}(s):
Mark all vertices as unvisited and initialize $T$ to be empty
Mark $s$ as visited and set $L_0 = \{s\}$

\[ i = 0 \]

while $L_i$ is not empty do
initialize $L_{i+1}$ to be an empty list
for each $u$ in $L_i$ do
for each edge $(u, v) \in \text{Adj}(u)$ do
if $v$ is not visited
mark $v$ as visited
add $(u, v)$ to tree $T$
add $v$ to $L_{i+1}$
\[ i = i + 1 \]
**BFS with Layers**

**BFSLayers(s):**
Mark all vertices as unvisited and initialize $T$ to be empty
Mark $s$ as visited and set $L_0 = \{s\}$
i = 0
while $L_i$ is not empty do
    initialize $L_{i+1}$ to be an empty list
    for each $u$ in $L_i$ do
        for each edge $(u, v) \in \text{Adj}(u)$ do
            if $v$ is not visited
                mark $v$ as visited
                add $(u, v)$ to tree $T$
                add $v$ to $L_{i+1}$
        i = i + 1
Running time: $O(n + m)$
BFS with Layers: Properties

Proposition

The following properties hold on termination of $\text{BFSLayers}(s)$.

1. $\text{BFSLayers}(s)$ outputs a BFS tree
2. $L_i$ is the set of vertices at distance exactly $i$ from $s$
3. If $G$ is undirected, each edge $e = \{u, v\}$ is one of three types:
   1. tree edge between two consecutive layers
   2. non-tree **forward/backward** edge between two consecutive layers
   3. non-tree cross-edge with both $u, v$ in same layer
4. $\implies$ Every edge in the graph is either between two vertices that are either (i) in the same layer, or (ii) in two consecutive layers.
A directed graph (also called a digraph) is $G = (V, E)$, where $V$ is a set of vertices or nodes, and $E \subseteq V \times V$ is a set of ordered pairs of vertices called edges.
The following properties hold on termination of BFS\text{Layers}(s), if $G$ is directed.

For each edge $e = (u, v)$ is one of four types:

1. a tree edge between consecutive layers, $u \in L_i, v \in L_{i+1}$ for some $i \geq 0$
2. a non-tree forward edge between consecutive layers
3. a non-tree backward edge
4. a cross-edge with both $u, v$ in same layer
Part II

Shortest Paths and Dijkstra’s Algorithm
Shortest Path Problems

**Input** A (undirected or directed) graph \( G = (V, E) \) with edge lengths (or costs). For edge \( e = (u, v) \), \( \ell(e) = \ell(u, v) \) is its length.

1. Given nodes \( s, t \) find shortest path from \( s \) to \( t \).
2. Given node \( s \) find shortest path from \( s \) to all other nodes.
3. Find shortest paths for all pairs of nodes.
Shortest Path Problems

Input A (undirected or directed) graph $G = (V, E)$ with edge lengths (or costs). For edge $e = (u, v)$, $\ell(e) = \ell(u, v)$ is its length.

1. Given nodes $s, t$ find shortest path from $s$ to $t$.
2. Given node $s$ find shortest path from $s$ to all other nodes.
3. Find shortest paths for all pairs of nodes.

Many applications!
**Single-Source Shortest Path Problems**

1. **Input:** A (undirected or directed) graph \( G = (V, E) \) with non-negative edge lengths. For edge \( e = (u, v) \), \( \ell(e) = \ell(u, v) \) is its length.

2. Given nodes \( s, t \) find shortest path from \( s \) to \( t \).

3. Given node \( s \) find shortest path from \( s \) to all other nodes.

Restrict attention to directed graphs.

Undirected graph problem can be reduced to directed graph problem - how?

Given undirected graph \( G \), create a new directed graph \( G' \) by replacing each edge \( \{u, v\} \) in \( G \) by \((u, v)\) and \((v, u)\) in \( G' \).

Set \( \ell(u, v) = \ell(v, u) = \ell(\{u, v\}) \).

Exercise: show reduction works. Relies on non-negativity!
Single-Source Shortest Path Problems

1. **Input:** A (undirected or directed) graph $G = (V, E)$ with non-negative edge lengths. For edge $e = (u, v)$, $\ell(e) = \ell(u, v)$ is its length.

2. Given nodes $s, t$ find shortest path from $s$ to $t$.

3. Given node $s$ find shortest path from $s$ to all other nodes.

---

Restrict attention to directed graphs

Undirected graph problem can be reduced to directed graph problem - how?
Single-Source Shortest Paths:
Non-Negative Edge Lengths

Single-Source Shortest Path Problems

1. **Input:** A (undirected or directed) graph $G = (V, E)$ with non-negative edge lengths. For edge $e = (u, v)$, $\ell(e) = \ell(u, v)$ is its length.

2. Given nodes $s, t$ find shortest path from $s$ to $t$.

3. Given node $s$ find shortest path from $s$ to all other nodes.

Restrict attention to directed graphs

Undirected graph problem can be reduced to directed graph problem - how?

1. Given undirected graph $G$, create a new directed graph $G'$ by replacing each edge $\{u, v\}$ in $G$ by $(u, v)$ and $(v, u)$ in $G'$.

2. set $\ell(u, v) = \ell(v, u) = \ell(\{u, v\})$

3. Exercise: show reduction works. Relies on non-negativity!
Special case: All edge lengths are 1.
**Special case:** All edge lengths are 1.

1. Run \textbf{BFS}(s) to get shortest path distances from s to all other nodes.
2. \( O(m + n) \) time algorithm.
Single-Source Shortest Paths via BFS

**Special case:** All edge lengths are 1.

1. Run **BFS**\((s)\) to get shortest path distances from \(s\) to all other nodes.

2. **O**\((m + n)\) time algorithm.

**Special case:** Suppose \(\ell(e)\) is an integer for all \(e\)? Can we use **BFS**?
**Single-Source Shortest Paths via BFS**

**Special case:** All edge lengths are $1$.

1. Run **BFS**($s$) to get shortest path distances from $s$ to all other nodes.
2. $O(m + n)$ time algorithm.

**Special case:** Suppose $\ell(e)$ is an integer for all $e$? Can we use **BFS**? Reduce to unit edge-length problem by placing $\ell(e) - 1$ dummy nodes on $e$. 

Let $L = \max_e \ell(e)$. New graph has $O(mL)$ edges and $O(mL + n)$ nodes. BFS takes $O(mL + n)$ time. Not efficient if $L$ is large.
Special case: All edge lengths are 1.

1. Run **BFS**\((s)\) to get shortest path distances from \(s\) to all other nodes.

2. **\(O(m + n)\)** time algorithm.

Special case: Suppose \(\ell(e)\) is an integer for all \(e\)? Can we use **BFS**? Reduce to unit edge-length problem by placing \(\ell(e) - 1\) dummy nodes on \(e\)

Let \(L = \max_e \ell(e)\). New graph has \(O(mL)\) edges and \(O(mL + n)\) nodes. **BFS** takes \(O(mL + n)\) time. Not efficient if \(L\) is large.
Towards an algorithm

Why does **BFS** work?

**Lemma**

Let $G$ be a directed graph with non-negative edge lengths. Let $\text{dist}(s,v)$ denote the shortest path length from $s$ to $v$. If $s = v_0 \to v_1 \to v_2 \to \ldots \to v_k$ is a shortest path from $s$ to $v_k$ then for $1 \leq i < k$:

1. $s = v_0 \to v_1 \to v_2 \to \ldots \to v_i$ is a shortest path from $s$ to $v_i$
2. $\text{dist}(s,v_i) \leq \text{dist}(s,v_k)$

Relies on non-negative edge lengths.

**Proof.**

Suppose not. Then for some $i < k$ there is a path $P'$ from $s$ to $v_i$ of length strictly less than that of $s = v_0 \to v_1 \to v_2 \to \ldots \to v_i$. Then $P'$ concatenated with $v_i \to v_{i+1} \to \ldots \to v_k$ contains a strictly shorter path to $v_k$ than $s = v_0 \to v_1 \to v_2 \to \ldots \to v_k$. For the second part, observe that edge lengths are non-negative.
Towards an algorithm

Why does **BFS** work?

**BFS**(s) explores nodes in increasing distance from **s**

Lemma

Let $G$ be a directed graph with non-negative edge lengths. Let $\text{dist}(s, v)$ denote the shortest path length from $s$ to $v$. If $s = v_0 \rightarrow v_1 \rightarrow v_2 \rightarrow \ldots \rightarrow v_k$ is a shortest path from $s$ to $v_k$ then for $1 \leq i < k$:

$s = v_0 \rightarrow v_1 \rightarrow v_2 \rightarrow \ldots \rightarrow v_i$ is a shortest path from $s$ to $v_i$

$\text{dist}(s, v_i) \leq \text{dist}(s, v_k)$.

Relies on non-neg edge lengths.

Proof.

Suppose not. Then for some $i < k$ there is a path $P'$ from $s$ to $v_i$ of length strictly less than that of $s = v_0 \rightarrow v_1 \rightarrow v_2 \rightarrow \ldots \rightarrow v_i$. Then $P'$ concatenated with $v_i \rightarrow v_{i+1} \rightarrow v_{i+2} \rightarrow \ldots \rightarrow v_k$ contains a strictly shorter path to $v_k$ than $s = v_0 \rightarrow v_1 \rightarrow v_2 \rightarrow \ldots \rightarrow v_k$. For the second part, observe that edge lengths are non-negative.
Towards an algorithm

$s = v_0$

$s = v_0$

A shorter path from $v_0$ to $v_6$. A contradiction.

Shortest path from $v_0$ to $v_6$
A Basic Strategy

Explore vertices in increasing order of distance from \( s \):
(For simplicity assume that nodes are at different distances from \( s \)
and that no edge has zero length)

Initialize for each node \( v \), \( \text{dist}(s, v) = \infty \)
Initialize \( S = \emptyset \),
for \( i = 1 \) to \(|V|\) do
  (* Invariant: \( S \) contains the \( i-1 \) closest nodes to \( s \) *)
  Among nodes in \( V \setminus S \), find the node \( v \) that is the
  \( i \)th closest to \( s \)
  Update \( \text{dist}(s, v) \)
  \( S = S \cup \{v\} \)
A Basic Strategy

Corollary

*The \(i\)th closest node is adjacent to \(S\).*
Finding the $i$th closest node

1. $S$ contains the $i - 1$ closest nodes to $s$
2. Want to find the $i$th closest node from $V - S$.

1. For each $u \in V - S$ let $P(s, u, S)$ be a shortest path from $s$ to $u$ using only nodes in $S$ as intermediate vertices.
2. Let $d'(s, u)$ be the length of $P(s, u, S)$
Finding the $i$th closest node

1. **$S$** contains the $i - 1$ closest nodes to $s$

2. Want to find the $i$th closest node from $V - S$.

For each $u \in V - S$ let $P(s, u, S)$ be a shortest path from $s$ to $u$ using only nodes in $S$ as intermediate vertices.

2. Let $d'(s, u)$ be the length of $P(s, u, S)$

Observations: for each $u \in V - S$,

1. $\text{dist}(s, u) \leq d'(s, u)$ since we are constraining the paths

2. $d'(s, u) = \min_{a \in S}(\text{dist}(s, a) + \ell(a, u))$ - Why?
Finding the \textit{i}th closest node

1. \( S \) contains the \( i - 1 \) closest nodes to \( s \)
2. Want to find the \( i \)th closest node from \( V - S \).

1. For each \( u \in V - S \) let \( P(s, u, S) \) be a shortest path from \( s \) to \( u \) using only nodes in \( S \) as intermediate vertices.
2. Let \( d'(s, u) \) be the length of \( P(s, u, S) \)

Observations: for each \( u \in V - S \),
1. \( \text{dist}(s, u) \leq d'(s, u) \) since we are constraining the paths
2. \( d'(s, u) = \min_{a \in S} (\text{dist}(s, a) + \ell(a, u)) \) - Why?

\textbf{Lemma}

\textit{If \( v \) is the \textit{i}th closest node to \( s \), then \( d'(s, v) = \text{dist}(s, v) \).}
Finding the $i$th closest node

Lemma

Given:

1. $S$: Set of $i - 1$ closest nodes to $s$.
2. $d'(s, u) = \min_{x \in S} (\text{dist}(s, x) + \ell(x, u))$

If $v$ is an $i$th closest node to $s$, then $d'(s, v) = \text{dist}(s, v)$.

Proof.

Let $v$ be the $i$th closest node to $s$. Then there is a shortest path $P$ from $s$ to $v$ that contains only nodes in $S$ as intermediate nodes (see previous claim). Therefore $d'(s, v) = \text{dist}(s, v)$. □
Finding the $i$th closest node

Lemma

If $v$ is an $i$th closest node to $s$, then $d'(s, v) = \text{dist}(s, v)$.

Corollary

The $i$th closest node to $s$ is the node $v \in V - S$ such that $d'(s, v) = \min_{u \in V - S} d'(s, u)$.

Proof.

For every node $u \in V - S$, $\text{dist}(s, u) \leq d'(s, u)$ and for the $i$th closest node $v$, $\text{dist}(s, v) = d'(s, v)$. Moreover, $\text{dist}(s, u) \geq \text{dist}(s, v)$ for each $u \in V - S$. 

□
Initialize for each node v: \( \text{dist}(s, v) = \infty \)
Initialize \( S = \emptyset \), \( d'(s, s) = 0 \)
for \( i = 1 \) to \( |V| \) do
  (* Invariant: \( S \) contains the \( i-1 \) closest nodes to \( s \) *)
  (* Invariant: \( d'(s,u) \) is shortest path distance from \( u \) to \( s \) using only \( S \) as intermediate nodes*)
  Let \( v \) be such that \( d'(s,v) = \min_{u \in V \setminus S} d'(s,u) \)
  \( \text{dist}(s,v) = d'(s,v) \)
  \( S = S \cup \{v\} \)
  for each node \( u \) in \( V \setminus S \) do
    \( d'(s,u) \leftarrow \min_{a \in S} \left( \text{dist}(s,a) + \ell(a,u) \right) \)

Correctness: By induction on \( i \) using previous lemmas.
Running time: \( O(n \cdot (n + m)) \) time.

1 \( n \) outer iterations. In each iteration, \( d'(s,u) \) for each \( u \) by scanning all edges out of nodes in \( S \); O(m + n) time/iteration.
Initialize for each node $v$: $\text{dist}(s, v) = \infty$

Initialize $S = \emptyset$, $d'(s, s) = 0$

for $i = 1$ to $|V|$ do

(* Invariant: $S$ contains the $i-1$ closest nodes to $s$ *)

Example
Example
Improved Algorithm

1. Main work is to compute the $d'(s, u)$ values in each iteration.
2. $d'(s, u)$ changes from iteration $i$ to $i + 1$ only because of the node $v$ that is added to $S$ in iteration $i$. 

$\text{Initialize for each node } v, \text{dist}(s, v) = d'(s, v) = \infty$

$\text{Initialize } S = \emptyset, \text{d'(s,s)} = 0$

for $i = 1$ to $|V|$ do

// $S$ contains the $i-1$ closest nodes to $s$, and the values of $d'(s, u)$ are current

$v$ be node realizing $d'(s, v) = \min_{u \in V - S} d'(s, u)$

$\text{dist}(s, v) = d'(s, v)$

$S = S \cup \{v\}$

Update $d'(s, u)$ for each $u$ in $V - S$ as follows:

$d'(s, u) = \min \left( d'(s, u), \text{dist}(s, v) + \ell(v, u) \right)$

Running time: $O(m + n^2)$ time.

1. $n$ outer iterations and in each iteration following steps
2. updating $d'(s, u)$ after $v$ added takes $O(\text{deg}(v))$ time so total work is $O(m)$ since a node enters $S$ only once
3. Finding $v$ from $d'(s, u)$ values is $O(n)$ time
Improved Algorithm

        $\text{dist}(s, u) = \min(\text{dist}(s, u), \text{dist}(s, v) + \ell(v, u))$

Priority Queues to maintain $\text{dist}$ values for faster running time

1. Using heaps and standard priority queues: $O((m + n) \log n)$
2. Using Fibonacci heaps: $O(m + n \log n)$. 
Priority Queues

Data structure to store a set $S$ of $n$ elements where each element $v \in S$ has an associated real/integer key $k(v)$ such that the following operations:

1. **makePQ**: create an empty queue.
2. **findMin**: find the minimum key in $S$.
3. **extractMin**: Remove $v \in S$ with smallest key and return it.
4. **insert**($v$, $k(v)$): Add new element $v$ with key $k(v)$ to $S$.
5. **delete**($v$): Remove element $v$ from $S$.

$decreaseKey(v, k'(v))$: decrease key of $v$ from $k(v)$ (current key) to $k'(v)$ (new key). Assumption: $k'(v) \leq k(v)$.

$meld$: merge two separate priority queues into one. All operations can be performed in $O(\log n)$ time.

$decreaseKey$ is implemented via $delete$ and $insert$. 
Priority Queues

Data structure to store a set $S$ of $n$ elements where each element $v \in S$ has an associated real/integer key $k(v)$ such that the following operations:

1. **makePQ**: create an empty queue.
2. **findMin**: find the minimum key in $S$.
3. **extractMin**: Remove $v \in S$ with smallest key and return it.
4. **insert**(v, k(v)): Add new element $v$ with key $k(v)$ to $S$.
5. **delete**(v): Remove element $v$ from $S$.
6. **decreaseKey**(v, k′(v)): decrease key of $v$ from $k(v)$ (current key) to $k′(v)$ (new key). Assumption: $k′(v) \leq k(v)$.
7. **meld**: merge two separate priority queues into one.
Priority Queues

Data structure to store a set $S$ of $n$ elements where each element $v \in S$ has an associated real/integer key $k(v)$ such that the following operations:

1. **makePQ**: create an empty queue.
2. **findMin**: find the minimum key in $S$.
3. **extractMin**: Remove $v \in S$ with smallest key and return it.
4. **insert** $(v, k(v))$: Add new element $v$ with key $k(v)$ to $S$.
5. **delete** $(v)$: Remove element $v$ from $S$.
6. **decreaseKey** $(v, k'(v))$: decrease key of $v$ from $k(v)$ (current key) to $k'(v)$ (new key). Assumption: $k'(v) \leq k(v)$.
7. **meld**: merge two separate priority queues into one.

All operations can be performed in $O(\log n)$ time.

**decreaseKey** is implemented via **delete** and **insert**.
Dijkstra’s Algorithm using Priority Queues

\[
\begin{align*}
Q & \leftarrow \text{makePQ}() \\
\text{insert}(Q, (s, 0)) \\
\text{for each node } u \neq s \text{ do} & \\
\text{insert}(Q, (u, \infty)) \\
S & \leftarrow \emptyset \\
\text{for } i = 1 \text{ to } |V| \text{ do} & \\
(v, \text{dist}(s, v)) & = \text{extractMin}(Q) \\
S & = S \cup \{v\} \\
\text{for each } u \text{ in } \text{Adj}(v) \text{ do} & \\
\text{decreaseKey}(Q, (u, \min(\text{dist}(s, u), \text{dist}(s, v) + \ell(v, u)))).
\end{align*}
\]

Priority Queue operations:

1. \(O(n)\) insert operations
2. \(O(n)\) extractMin operations
3. \(O(m)\) decreaseKey operations
Implementing Priority Queues via Heaps

Using Heaps

Store elements in a heap based on the key value

- All operations can be done in $O(\log n)$ time
Implementing Priority Queues via Heaps

Using Heaps

Store elements in a heap based on the key value

1. All operations can be done in $O(\log n)$ time

Dijkstra’s algorithm can be implemented in $O((n + m) \log n)$ time.
### Fibonacci Heaps

1. `extractMin`, `insert`, `delete`, `meld` in $O(\log n)$ time
2. `decreaseKey` in $O(1)$ amortized time:

### Relaxed Heaps:

- `decreaseKey` in $O(1)$ worst case time but at the expense of `meld` (not necessary for Dijkstra's algorithm)

Dijkstra's algorithm can be implemented in $O(n \log n + m)$ time. If $m = \Omega(n \log n)$, running time is linear in input size.

Data structures are complicated to analyze/implement. Recent work has obtained data structures that are easier to analyze and implement, and perform well in practice.

Rank-Pairing Heaps (European Symposium on Algorithms, September 2009!)

Chandra & Lenny (UIUC)
Fibonacci Heaps

1. **extractMin, insert, delete, meld** in $O(\log n)$ time
2. **decreaseKey** in $O(1)$ amortized time: $\ell$ decreaseKey operations for $\ell \geq n$ take together $O(\ell)$ time
3. Relaxed Heaps: **decreaseKey** in $O(1)$ worst case time but at the expense of **meld** (not necessary for Dijkstra’s algorithm)
Fibonacci Heaps

Dijkstra’s algorithm finds the shortest path distances from $s$ to $V$. **Question:** How do we find the paths themselves?
Dijkstra’s algorithm finds the shortest path distances from s to V.

**Question:** How do we find the paths themselves?

```plaintext
Q = makePQ()
insert(Q, (s, 0))
prev(s) ⇐ null
for each node u ≠ s do
    insert(Q, (u, ∞))
    prev(u) ⇐ null

S = ∅
for i = 1 to |V| do
    (v, dist(s, v)) = extractMin(Q)
    S = S ∪ {v}
    for each u in Adj(v) do
        if (dist(s, v) + ℓ(v, u) < dist(s, u)) then
            decreaseKey(Q, (u, dist(s, v) + ℓ(v, u))
            prev(u) = v
```

Chandra & Lenny (UIUC)
**Lemma**

The edge set \((u, \text{prev}(u))\) is the reverse of a shortest path tree rooted at \(s\). For each \(u\), the reverse of the path from \(u\) to \(s\) in the tree is a shortest path from \(s\) to \(u\).

**Proof Sketch.**

1. The edge set \(\{(u, \text{prev}(u)) \mid u \in V\}\) induces a directed in-tree rooted at \(s\) (Why?)
2. Use induction on \(|S|\) to argue that the tree is a shortest path tree for nodes in \(V\).
Shortest paths to \( s \)

Dijkstra’s algorithm gives shortest paths from \( s \) to all nodes in \( V \). How do we find shortest paths from all of \( V \) to \( s \)?
Dijkstra’s algorithm gives shortest paths from \( s \) to all nodes in \( V \). How do we find shortest paths from all of \( V \) to \( s \)?

1. In undirected graphs shortest path from \( s \) to \( u \) is a shortest path from \( u \) to \( s \) so there is no need to distinguish.

2. In directed graphs, use Dijkstra’s algorithm in \( G^{\text{rev}} \).
Shortest paths between sets of nodes

Suppose we are given $S \subseteq V$ and $T \subseteq V$. Want to find shortest path from $S$ to $T$ defined as:

$$dist(S, T) = \min_{s \in S, t \in T} \{dist(s, t)\}$$

How do we find $dist(S, T)$?
Part III

Bipartite Graphs and an application of BFS
Bipartite Graphs

Definition (Bipartite Graph)

Undirected graph $G = (V, E)$ is a **bipartite graph** if $V$ can be partitioned into $X$ and $Y$ s.t. all edges in $E$ are between $X$ and $Y$. 

![Bipartite Graph Diagram]
Question
When is a graph bipartite?

Proposition
Every tree is a bipartite graph.

Proof.
Root tree $T$ at some node $r$. Let $L_i$ be all nodes at level $i$, that is, $L_i$ is all nodes at distance $i$ from root $r$. Now define $X$ to be all nodes at even levels and $Y$ to be all nodes at odd level. Only edges in $T$ are between levels.

Proposition
An odd length cycle is not bipartite.
**Question**
When is a graph bipartite?

**Proposition**
*Every tree is a bipartite graph.*
Question
When is a graph bipartite?

Every tree is a bipartite graph.

Proof.
Root tree $T$ at some node $r$. Let $L_i$ be all nodes at level $i$, that is, $L_i$ is all nodes at distance $i$ from root $r$. Now define $X$ to be all nodes at even levels and $Y$ to be all nodes at odd level. Only edges in $T$ are between levels.
Question
When is a graph bipartite?

Proposition
Every tree is a bipartite graph.

Proof.
Root tree $T$ at some node $r$. Let $L_i$ be all nodes at level $i$, that is, $L_i$ is all nodes at distance $i$ from root $r$. Now define $X$ to be all nodes at even levels and $Y$ to be all nodes at odd level. Only edges in $T$ are between levels.

Proposition
An odd length cycle is not bipartite.
Odd Cycles are not Bipartite

Proposition

An odd length cycle is not bipartite.

Proof.

Let $C = u_1, u_2, \ldots, u_{2k+1}, u_1$ be an odd cycle. Suppose $C$ is a bipartite graph and let $X, Y$ be the partition. Without loss of generality $u_1 \in X$. Implies $u_2 \in Y$. Implies $u_3 \in X$. Inductively, $u_i \in X$ if $i$ is odd $u_i \in Y$ if $i$ is even. But $\{u_1, u_{2k+1}\}$ is an edge and both belong to $X$!
Subgraphs

Definition

Given a graph $G = (V, E)$ a subgraph of $G$ is another graph $H = (V', E')$ where $V' \subseteq V$ and $E' \subseteq E$. 

Proposition

If $G$ is bipartite then any subgraph $H$ of $G$ is also bipartite.

Proposition

A graph $G$ is not bipartite if $G$ has an odd cycle $C$ as a subgraph.

Proof.

If $G$ is bipartite then since $C$ is a subgraph, $C$ is also bipartite (by above proposition). However, $C$ is not bipartite!
Subgraphs

Definition
Given a graph $G = (V, E)$ a subgraph of $G$ is another graph $H = (V', E')$ where $V' \subseteq V$ and $E' \subseteq E$.

Proposition
If $G$ is bipartite then any subgraph $H$ of $G$ is also bipartite.
Subgraphs

Definition
Given a graph $G = (V, E)$ a subgraph of $G$ is another graph $H = (V', E')$ where $V' \subseteq V$ and $E' \subseteq E$.

Proposition
If $G$ is bipartite then any subgraph $H$ of $G$ is also bipartite.

Proposition
A graph $G$ is not bipartite if $G$ has an odd cycle $C$ as a subgraph.
Subgraphs

**Definition**

Given a graph $G = (V, E)$ a **subgraph** of $G$ is another graph $H = (V', E')$ where $V' \subseteq V$ and $E' \subseteq E$.

**Proposition**

If $G$ is bipartite then any subgraph $H$ of $G$ is also bipartite.

**Proposition**

A graph $G$ is not bipartite if $G$ has an odd cycle $C$ as a subgraph.

**Proof.**

If $G$ is bipartite then since $C$ is a subgraph, $C$ is also bipartite (by above proposition). However, $C$ is not bipartite!
Theorem

A graph $G$ is bipartite if and only if it has no odd length cycle as subgraph.

Proof.

Only If: $G$ has an odd cycle implies $G$ is not bipartite.
**Theorem**

A graph $G$ is bipartite if and only if it has no odd length cycle as subgraph.

**Proof.**

**Only If:** $G$ has an odd cycle implies $G$ is not bipartite.

**If:** $G$ has no odd length cycle. Assume without loss of generality that $G$ is connected.

1. Pick $u$ arbitrarily and do $\text{BFS}(u)$
2. $X = \cup_{\text{is even}} L_i$ and $Y = \cup_{\text{is odd}} L_i$
3. **Claim:** $X$ and $Y$ is a valid partition if $G$ has no odd length cycle.
Proof of Claim

Claim

\[ \text{In BFS}(u) \text{ if } a, b \in L_i \text{ and } (a, b) \text{ is an edge then there is an odd length cycle containing } (a, b). \]
Proof of Claim

Claim

In $\text{BFS}(u)$ if $a, b \in L_i$ and $(a, b)$ is an edge then there is an odd length cycle containing $(a, b)$.

Proof.

Let $v$ be least common ancestor of $a, b$ in BFS tree $T$. $v$ is in some level $j < i$ (could be $u$ itself).
Path from $v \xrightarrow{} a$ in $T$ is of length $i - j$.
Path from $v \xrightarrow{} b$ in $T$ is of length $i - j$.
These two paths plus $(a, b)$ forms an odd cycle of length $2(i - j) + 1$. 

Proof of Claim: Figure
Is this graph bipartite?
Is this graph bipartite?
Is this graph bipartite?
Is this graph bipartite?
Is this graph bipartite?
Is this graph bipartite?
Is this graph bipartite?
Is this graph bipartite?
Corollary

There is an $O(n + m)$ time algorithm to check if $G$ is bipartite and output an odd cycle if it is not.

**Question:** Can you come up with an efficient algorithm to check whether a given graph $G$ has an even length cycle and find one if it has? What is the running time of your algorithm?
