Announcements

Final project upcoming deadlines:

- **Oct 27**, submit two .jpg files as the answer to my piazza post:
 1. Image for abstract/title. These will be posted on the class webpage:
<https://courses.engr.illinois.edu/cs498sl/gallery.php>

You are showing the world what is possible!
<http://csctr.cs.umd.edu/>
 2. Snapshot of your first scene for the final project in Unity
- **Nov 3**, a short video of your progress.

Unity Tutorials: Wed Oct 14 6pm , Th Oct 15 6pm

Eye Motion and VR: 3. Interaction with Photoreceptors

1. Pixels on the display switch their color/intensity at some non-zero rate.
2. There is RGB sub pixel structure.
3. Frames might be off (black) at particular times.
4. Asynchronous (line-by-line) display scan out.
5. Photoreceptors are slow to respond. It takes them about 0.1-0.2 seconds to respond.
6. All of the eye movements shift the image on the retina.

low-persistent display

VOR and HMD

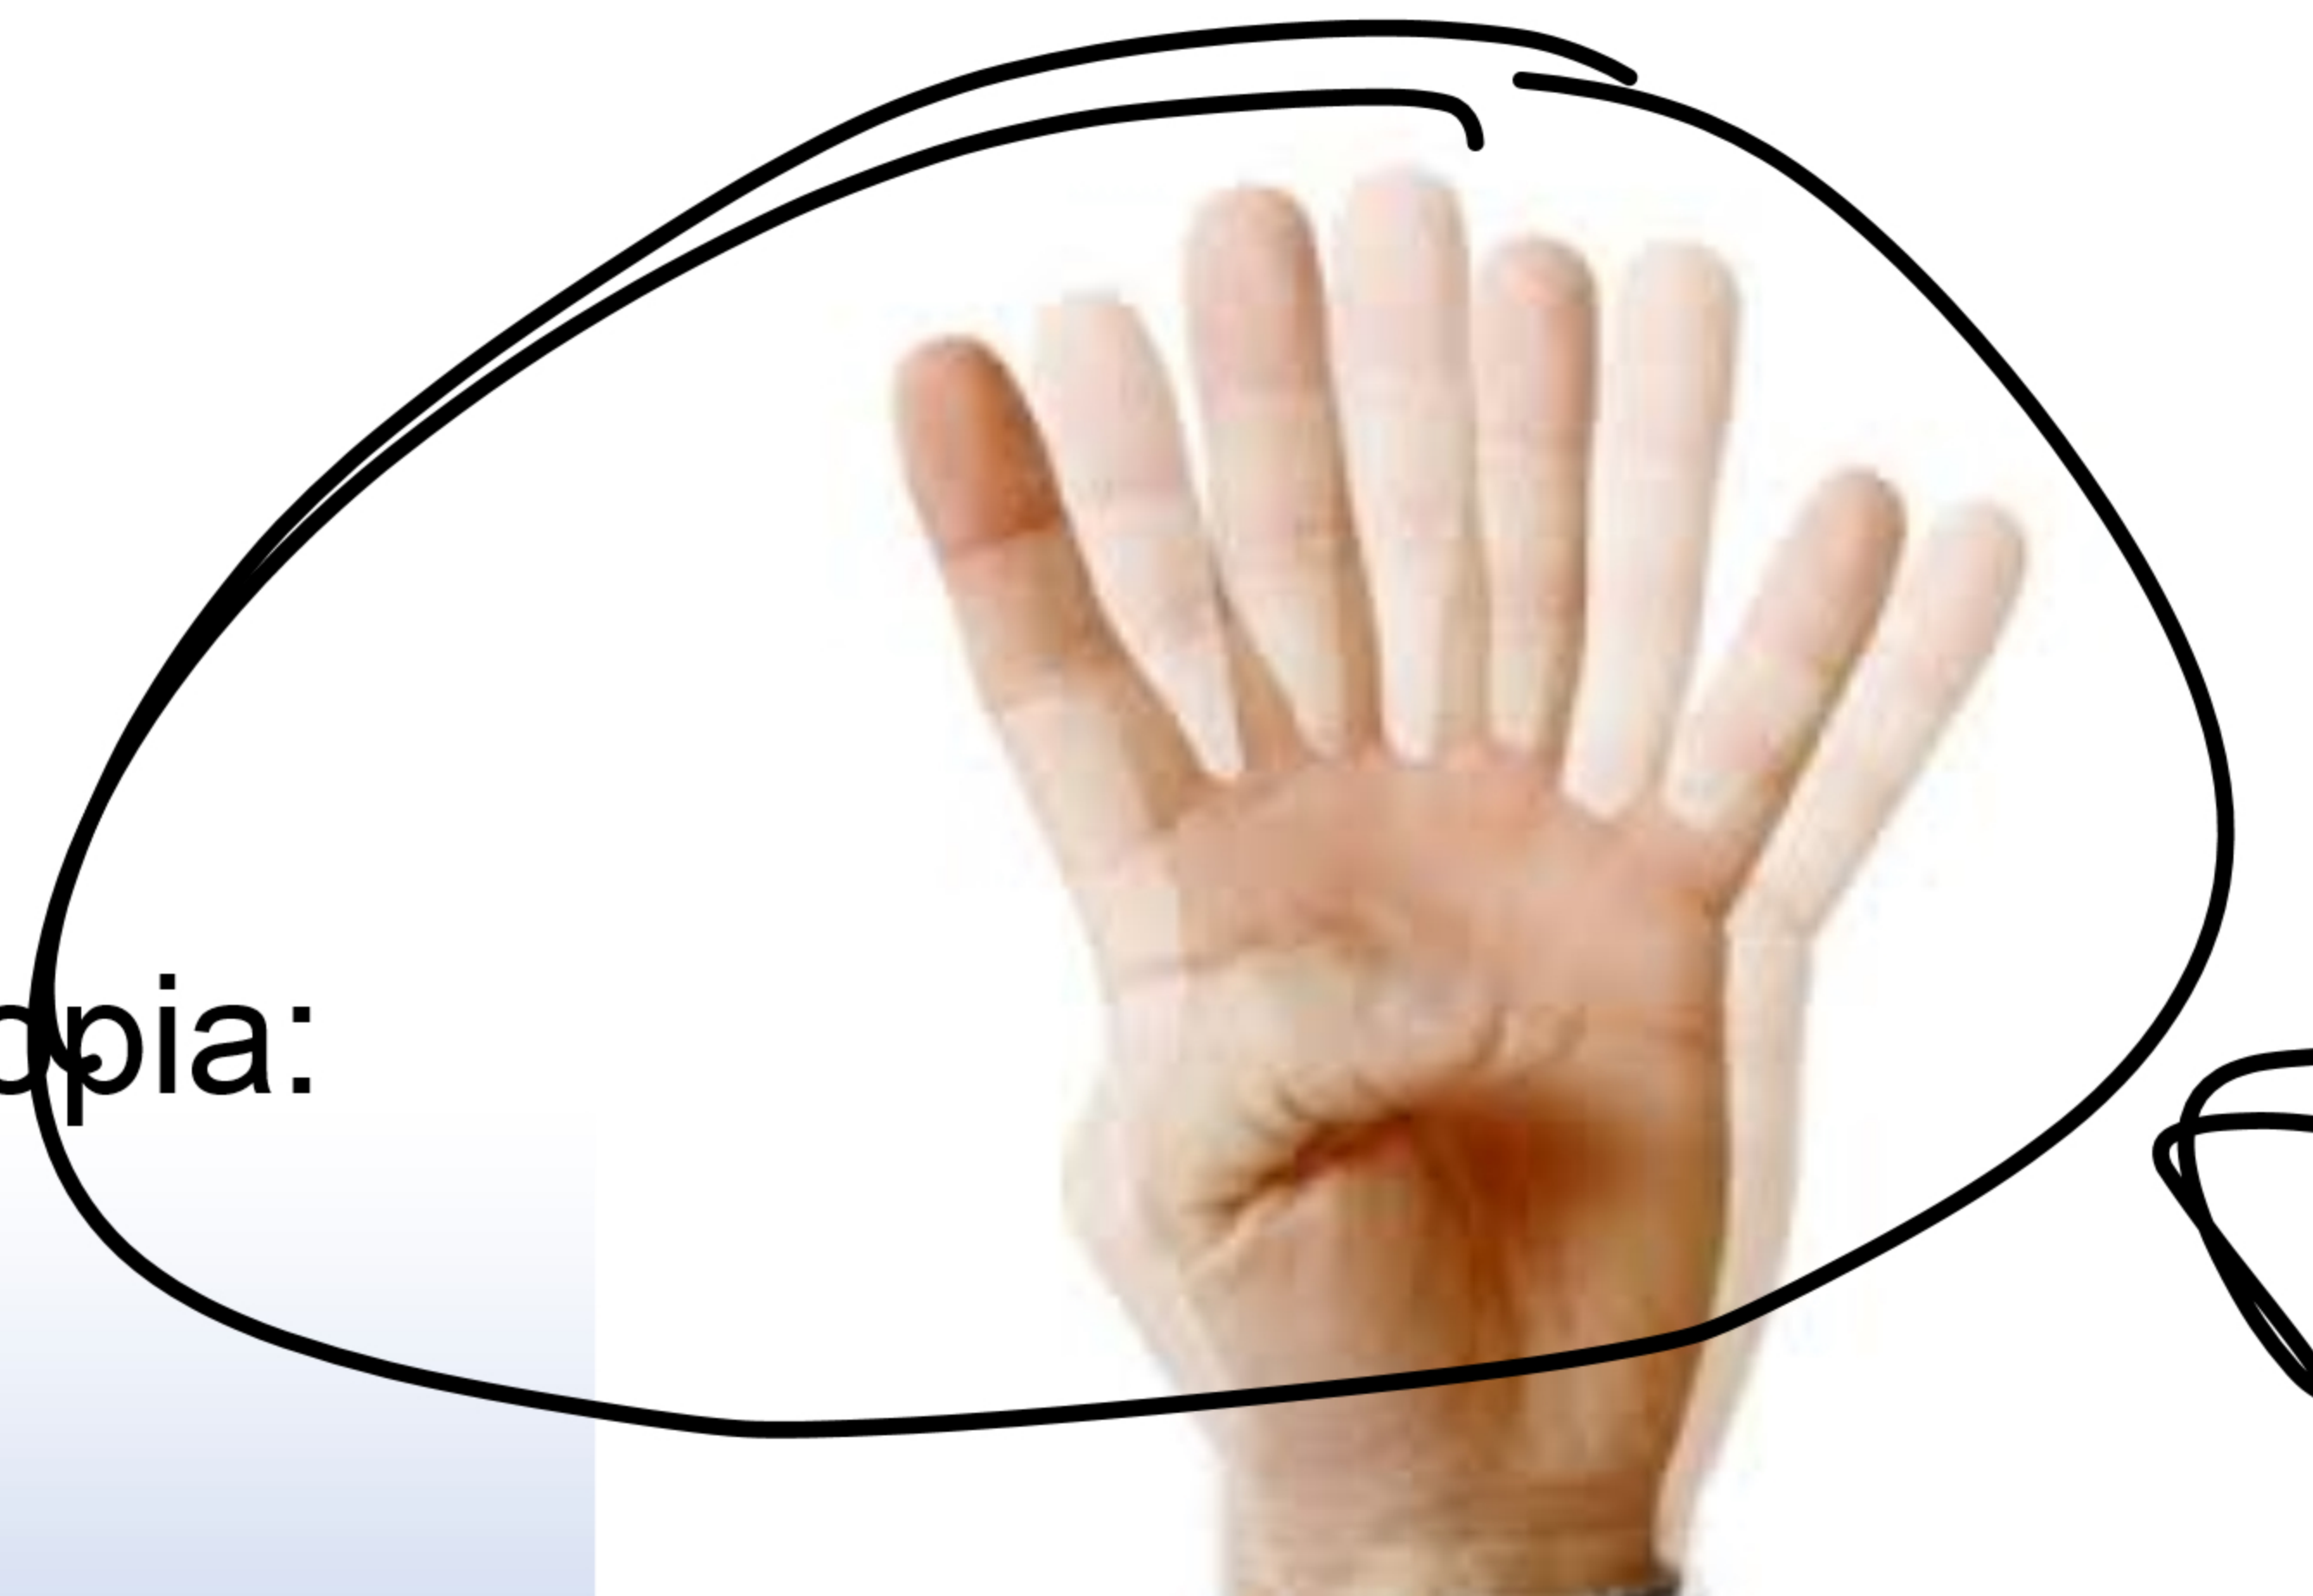

Frame Rate 60Hz
→ 16.7ms

judder
pixel switch time
OLED: 80μs
LCD: ~~20ms~~

Eye Motion and VR: 4. Vergence : diverg. converg.

Diplopia:

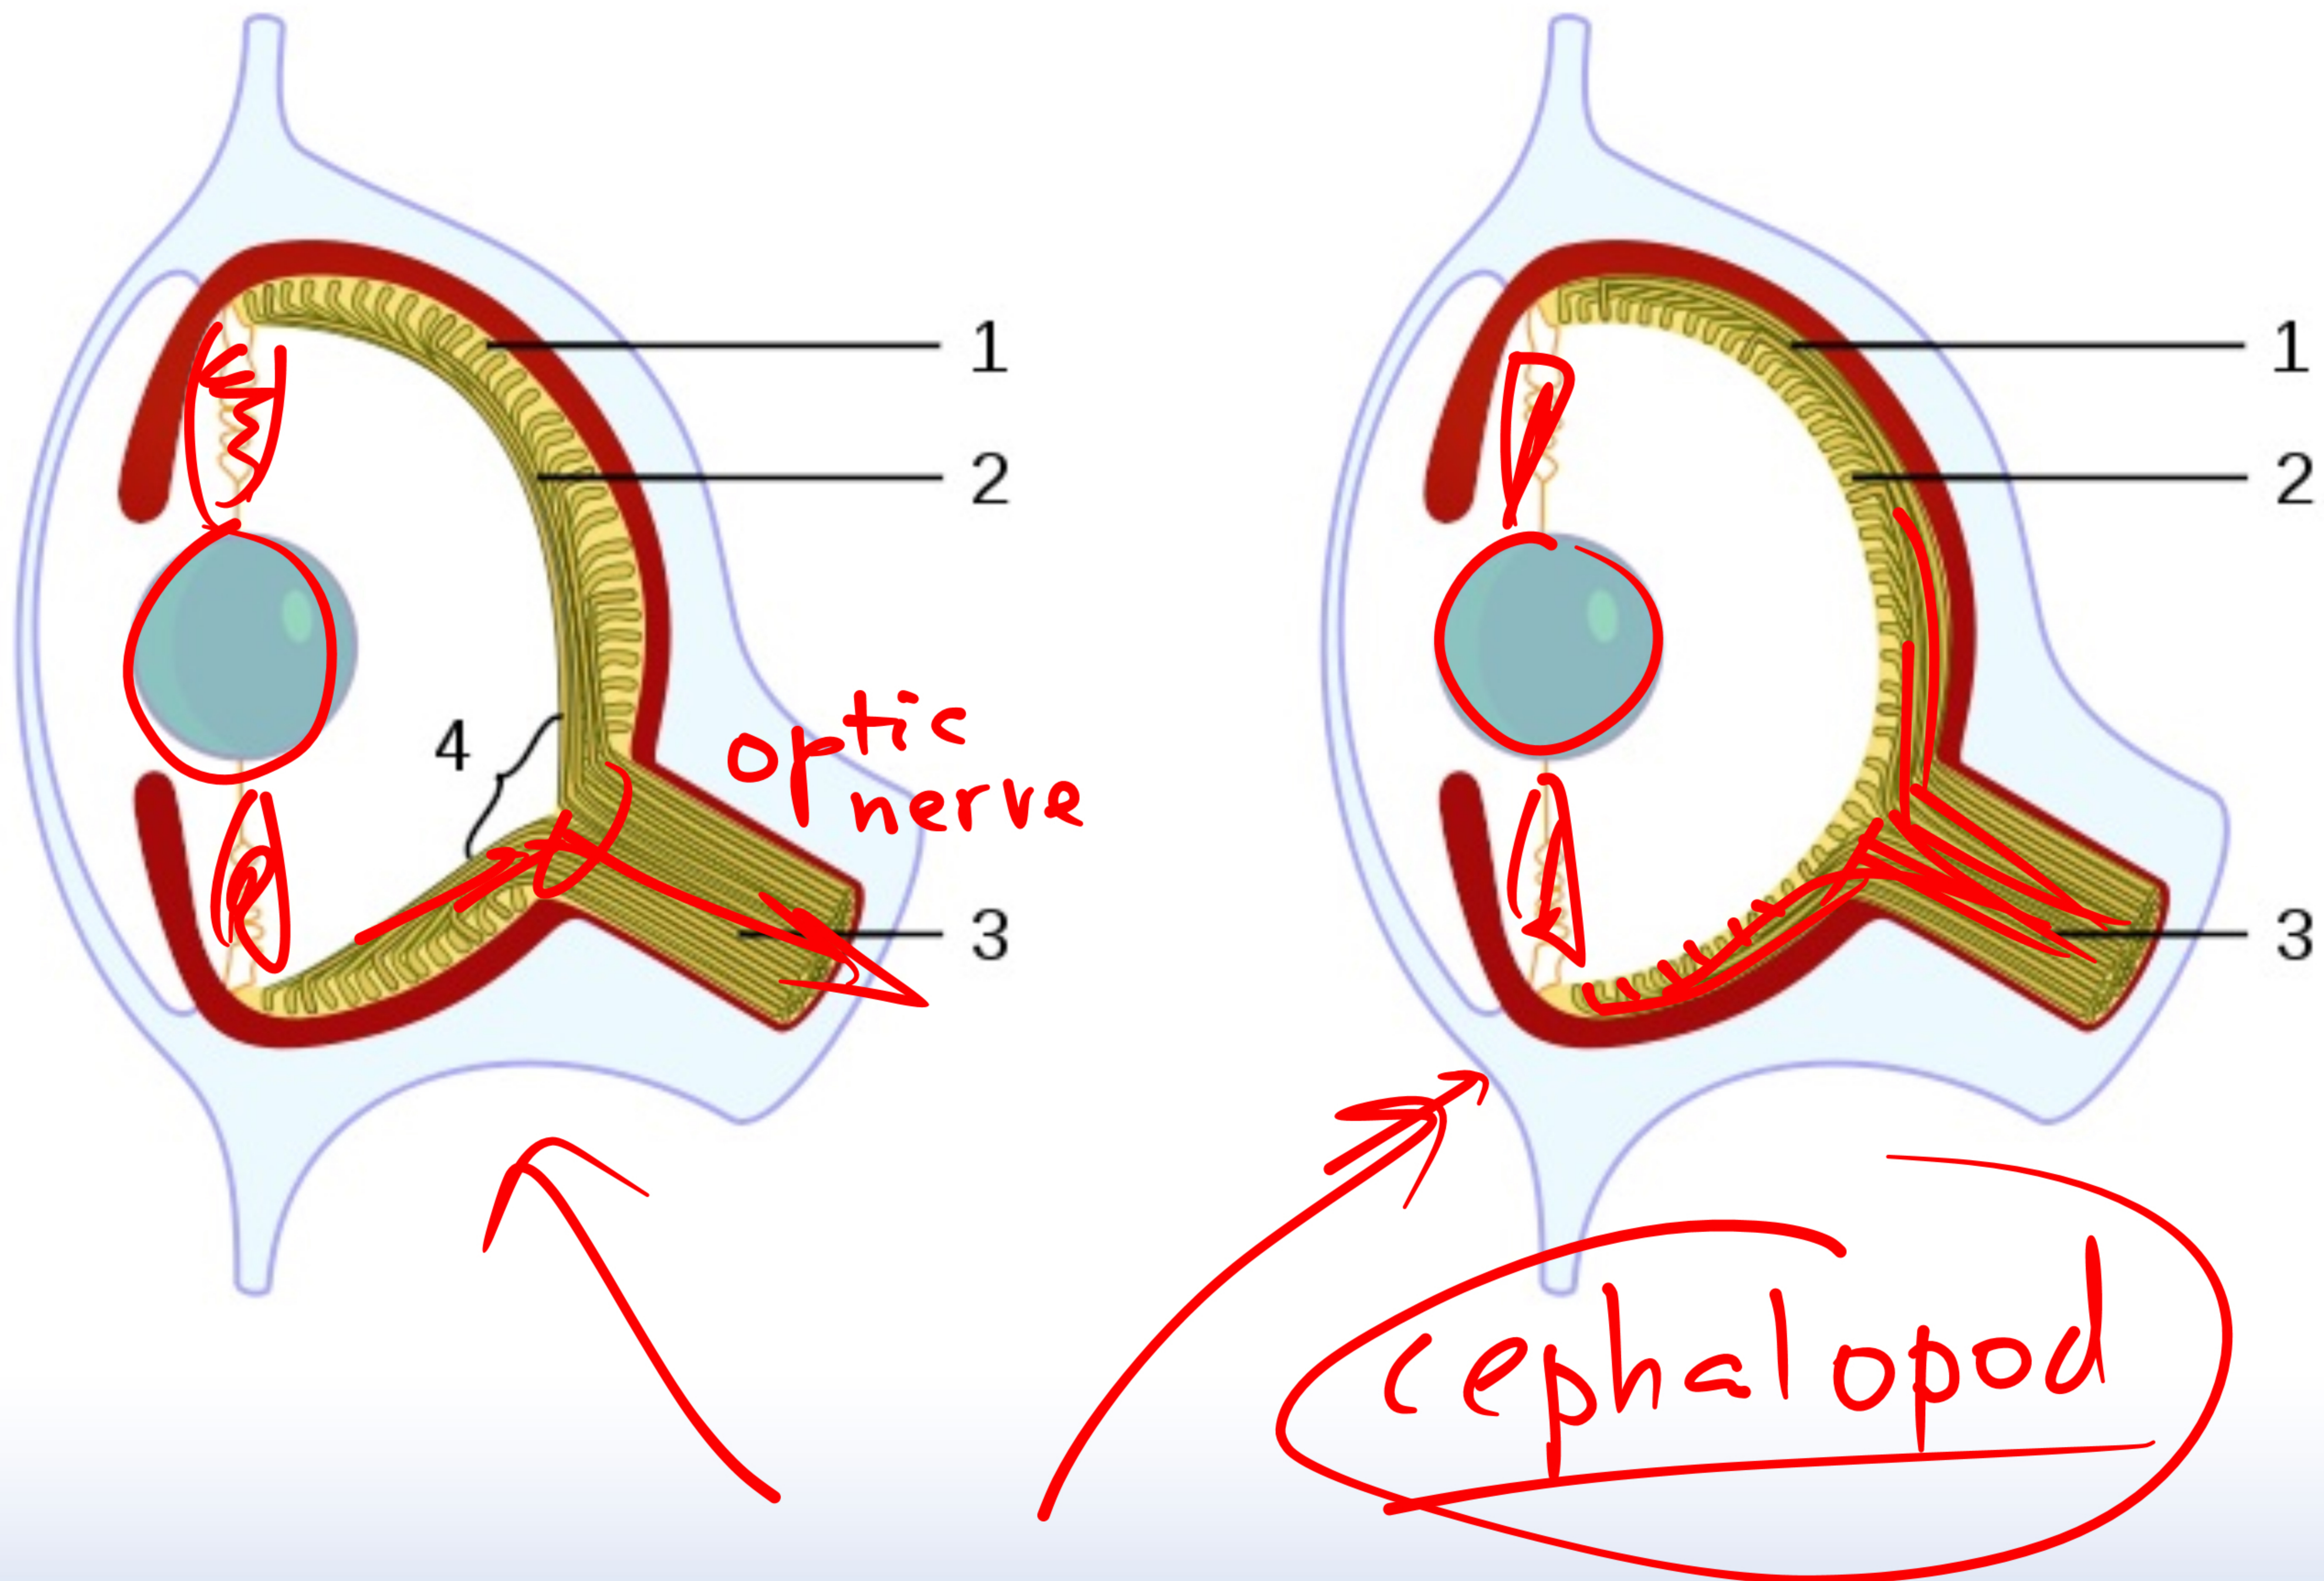

tightly
coupled
with ciliary
muscles

Depth Perception: Depth Cues

Importance to VR: If we present enough depth cues to the brain, the brain can be tricked into doing the computations instead of GPUs and CPUs!!!

Depth Perception:
