TARCIL: RECONCILING SCHEDULING SPEED AND QUALITY IN LARGE SCALE CLUSTERS

Scriber: Ailing Zhang
Apr 12, 2016
SUMMARY

Motivation
➤ Current schedulers either aim at scheduling speed or scheduling quality.

Key Contribution
➤ Use sampling to find available resources & identify resources that best match a job’s preference
➤ Admission Control: queues jobs until appropriate resource is available
**PROS:**

- Achieves good performance for both short and long jobs.
- Analytical framework provides statistical guarantee for the quality of scheduling decisions.
- Evaluation section is thorough and well organized.

**CONS:**

- Tarcil profiles each job to determine its resource preference. (caused high overhead for short jobs)
- Low priority tasks may suffer high overhead when more than a third of tasks have high priority.
DISCUSSION

➤ An RU is a fixed unit of resource. Can the resource of RUs be broken down to provide better quality?

➤ How is network bandwidth allocation achieved?

We currently use Linux containers to partition servers into RUs. Containers enable CPU, memory, and I/O isolation.

Each container is configured to a single core and a fair share of the memory and storage subsystem, and network bandwidth.
