

# Context and Spatial Layout

Computer Vision  
CS 543 / ECE 549  
University of Illinois

Derek Hoiem

# Announcements

- Lana is looking for students!
- HW5 almost graded, done by Tues

# Today's class: Context and 3D Scenes

# Context in Recognition

- Objects usually are surrounded by a scene that can provide context in the form of nearby objects, surfaces, scene category, geometry, etc.

# Context provides clues for function

- What is this?

# Context provides clues for function

---

- What is this?

- Now can you tell?

Sometimes context is *the* major component of recognition

- What is this?

# Sometimes context is *the* major component of recognition

- What is this?

- Now can you tell?

# More Low-Res

- What are these blobs?

# More Low-Res

- The same pixels! (a car)

# There are many types of context

- **Local pixels**
  - window, surround, image neighborhood, object boundary/shape, global image statistics
- **2D Scene Gist**
  - global image statistics
- **3D Geometric**
  - 3D scene layout, support surface, surface orientations, occlusions, contact points, etc.
- **Semantic**
  - event/activity depicted, scene category, objects present in the scene and their spatial extents, keywords
- **Photogrammetric**
  - camera height orientation, focal length, lens distortion, radiometric, response function
- **Illumination**
  - sun direction, sky color, cloud cover, shadow contrast, etc.
- **Geographic**
  - GPS location, terrain type, land use category, elevation, population density, etc.
- **Temporal**
  - nearby frames of video, photos taken at similar times, videos of similar scenes, time of capture
- **Cultural**
  - photographer bias, dataset selection bias, visual cliches, etc.

# Cultural context

# Cultural context

“Mildred and Lisa”: Who is Mildred? Who is Lisa?

# Cultural context

Age given Appearance

Age given Name

$$P(f_g|f_a) = \begin{bmatrix} 0.563 \\ 0.437 \end{bmatrix}$$

Mildred

$$P(f_g|n = \text{Mildred}) = \begin{bmatrix} 0.999 \\ 0.001 \end{bmatrix}$$

3.88

3.88

4.77

Lisa

$$P(f_g|f_a) = \begin{bmatrix} 0.687 \\ 0.313 \end{bmatrix}$$

$$P(f_g|n = \text{Lisa}) = \begin{bmatrix} 0.998 \\ 0.002 \end{bmatrix}$$

# Spatial layout is especially important

1. Context for recognition
2. Scene understanding

# Spatial layout is especially important

1. Context for recognition
2. Scene understanding
3. Many direct applications
  - a) Assisted driving
  - b) Robot navigation/interaction
  - c) 2D to 3D conversion for 3D TV
  - d) Object insertion

3D Reconstruction: Input, Mesh, Novel View

Robot Navigation: Path Planning

# Spatial Layout: 2D vs. 3D?

# Context in Image Space

[Torralba Murphy Freeman 2004]

21

[Kumar Hebert 2005]

[He Zemel Cerreira-Perpiñán 2004]

# But object relations are in 3D...

# How to represent scene space?

# Wide variety of possible representations

## Scene-Level Geometric Description

a) Gist, Spatial Envelope

b) Stages

## Retinotopic Maps

### c) Geometric Context

### d) Depth Maps

## Highly Structured 3D Models

e) Ground Plane

f) Ground Plane with Billboards

g) Ground Plane with Walls

h) Blocks World

i) 3D Box Model

# Key Trade-offs

- Level of detail: rough “gist”, or detailed point cloud?
  - Precision vs. accuracy
  - Difficulty of inference
- Abstraction: depth at each pixel, or ground planes and walls?
  - What is it for: e.g., metric reconstruction vs. navigation

# Low detail, Low/Med abstraction

## Holistic Scene Space: “Gist”

Oliva & Torralba 2001

Torralba & Oliva 2002

# High detail, Low abstraction

**Depth Map**

Saxena, Chung & Ng 2005, 2007

# Medium detail, High abstraction

## Room as a Box

Hedau Hoiem Forsyth 2009

# Examples of spatial layout estimation

- Surface layout
  - Application to 3D reconstruction
- The room as a box
  - Application to object recognition

# Surface Layout: describe 3D surfaces with geometric classes

# The challenge

# Our World is Structured

Abstract World

Our World

# Learn the Structure of the World

## Training Images

# Infer the most likely interpretation

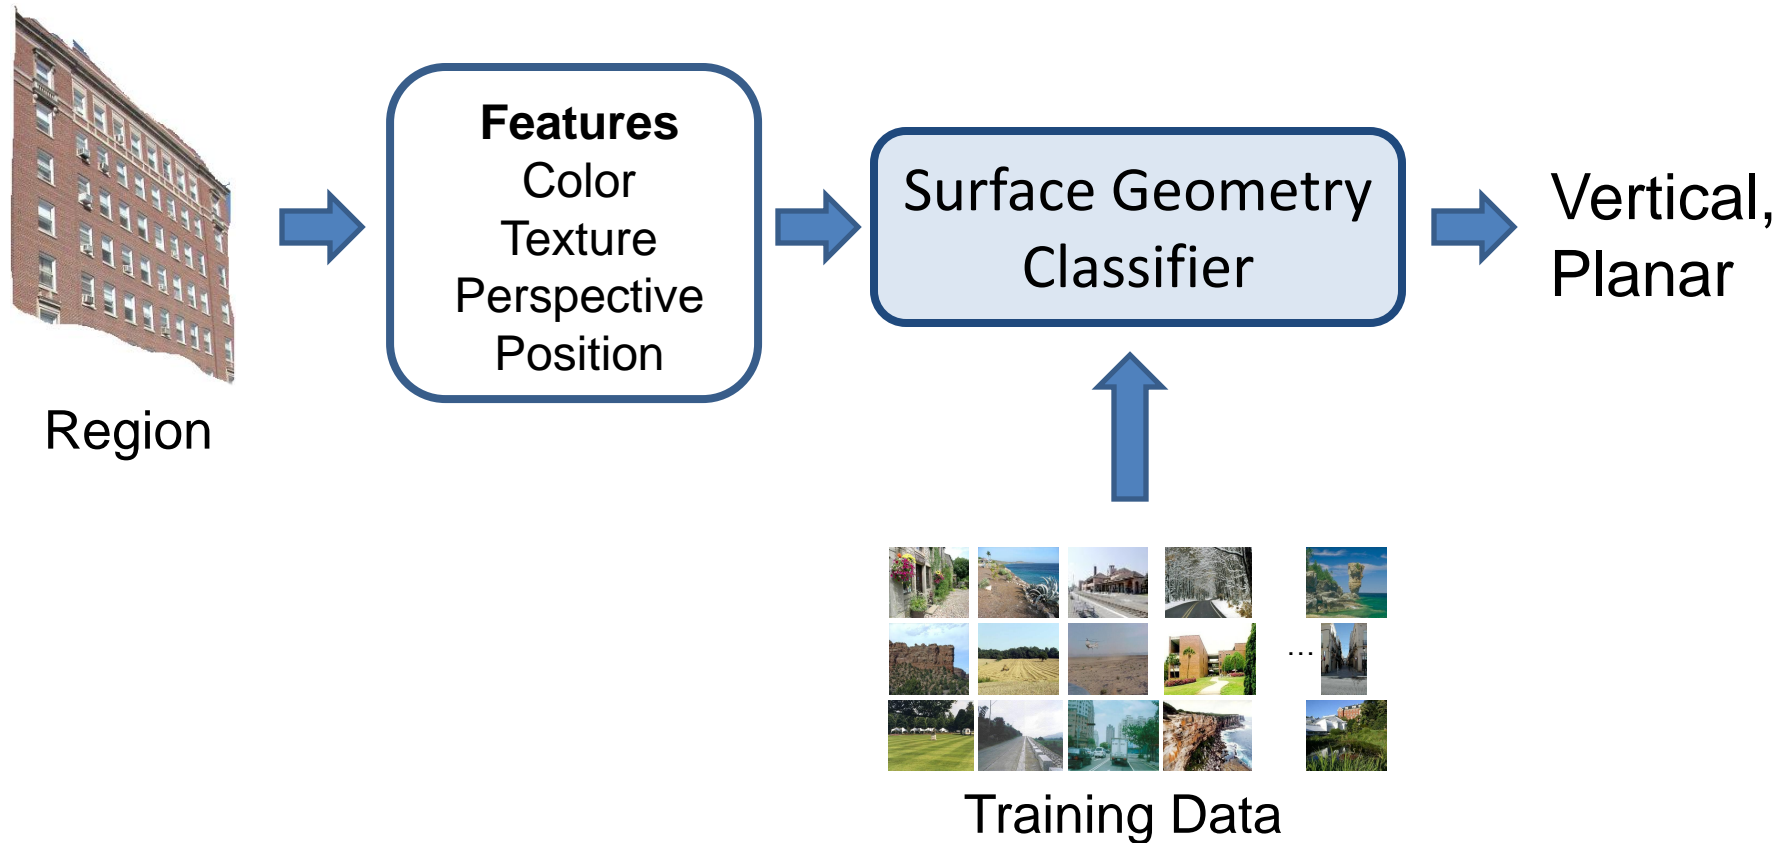

Unlikely

Likely

# Geometry estimation as recognition

# Use a variety of image cues

Vanishing points, lines

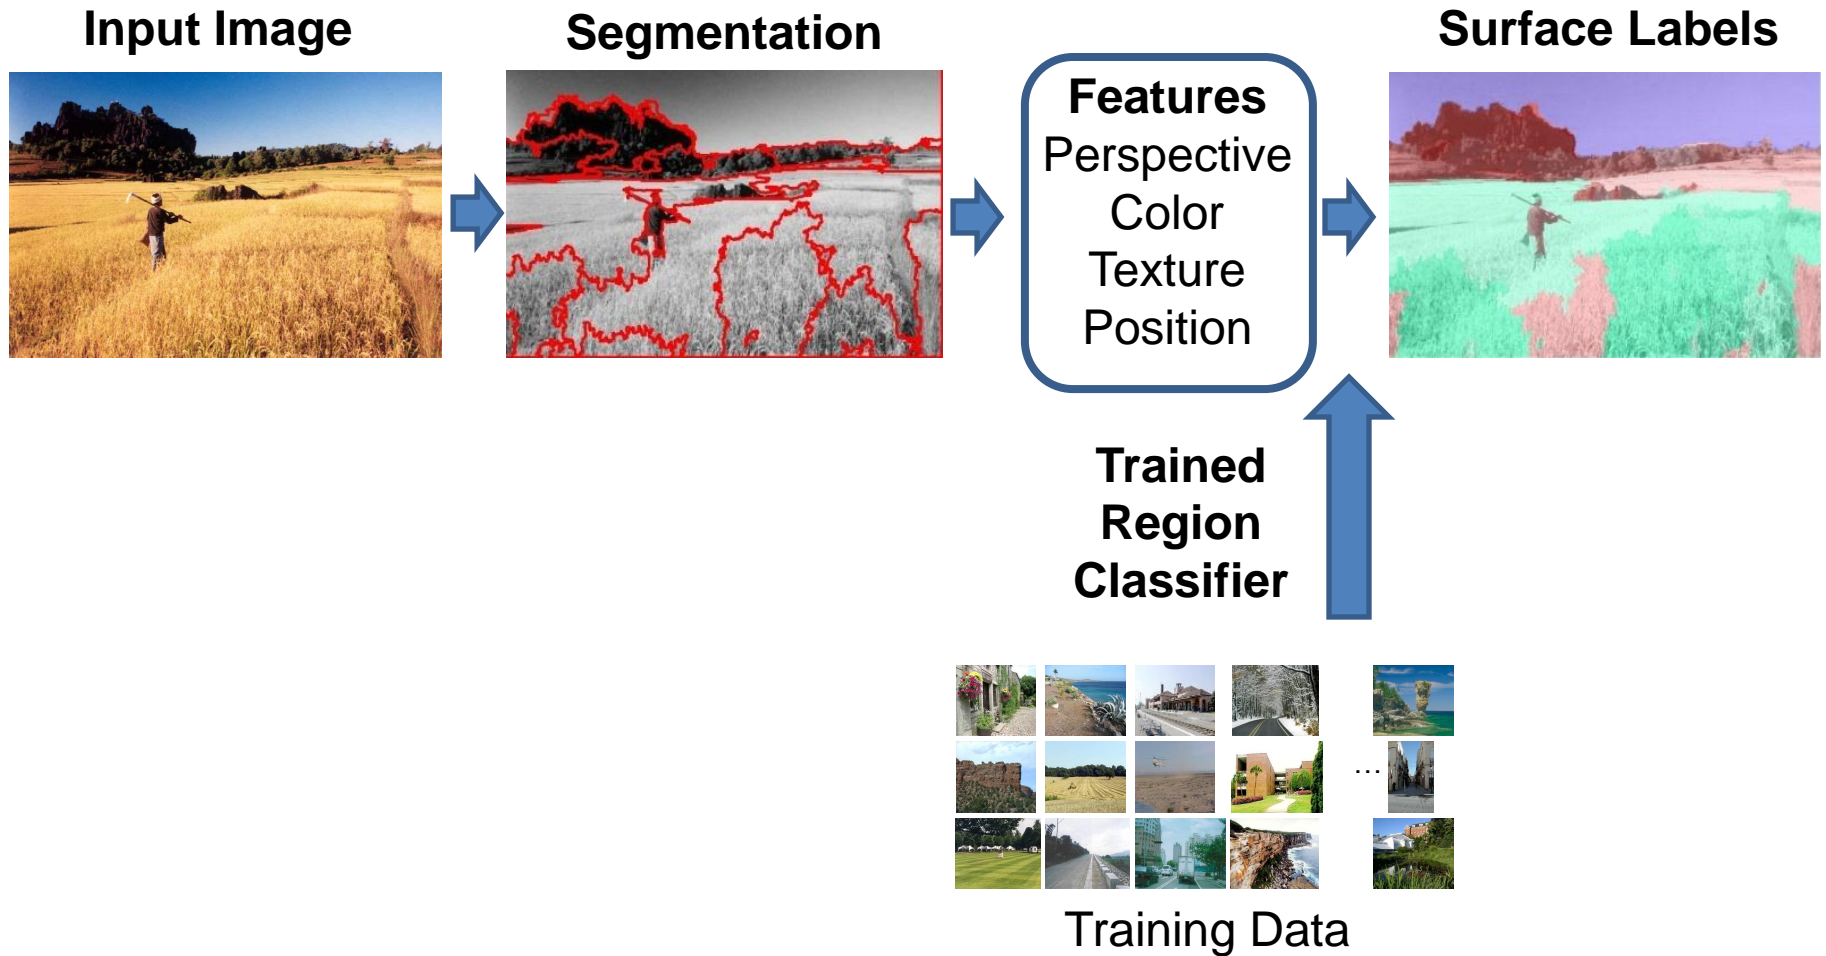

Color, texture, image location

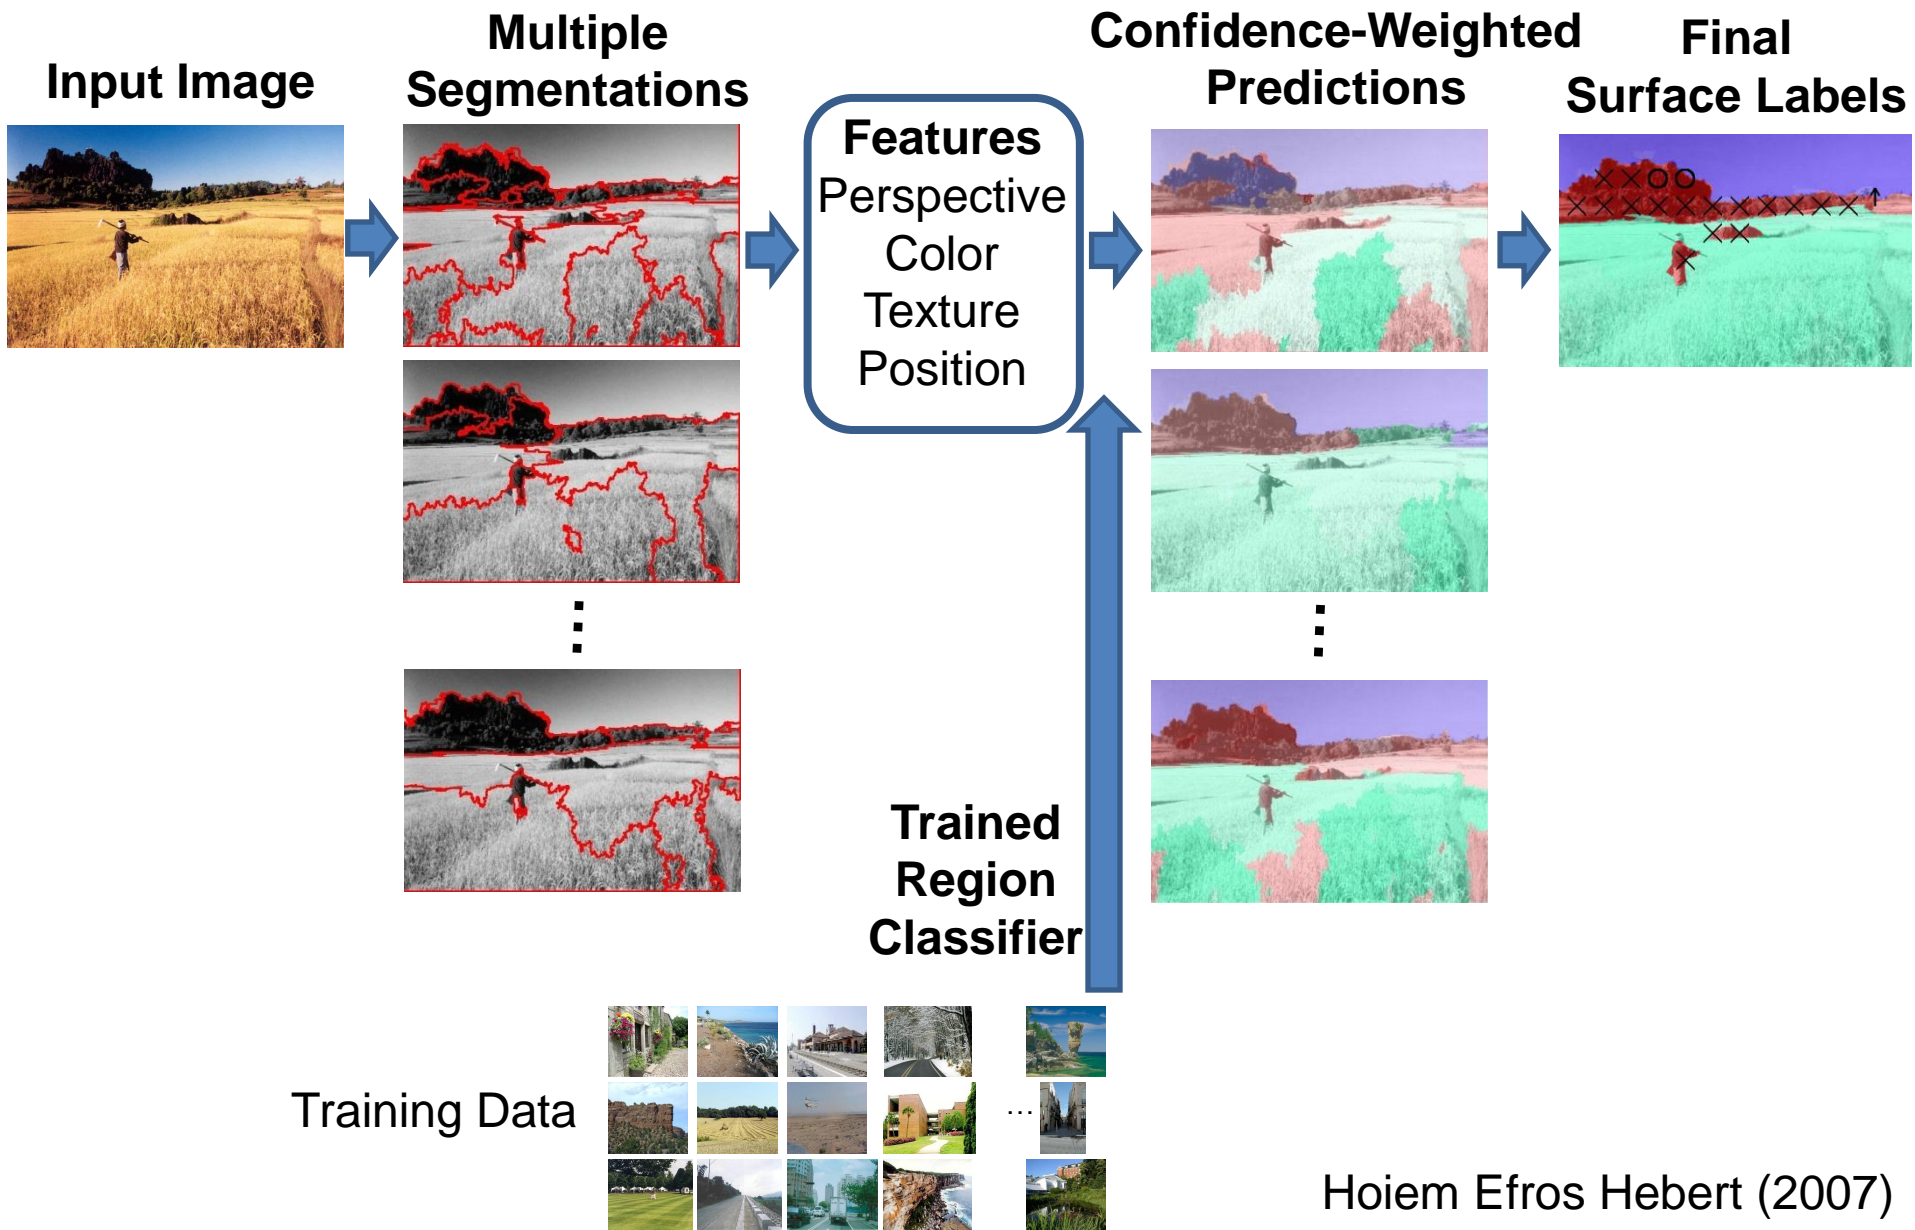

Texture gradient

Segments

Form Segments  
into Polylines

Cut and Fold

Final Pop-up Model

# Automatic Photo Popup

# Mini-conclusions

- Can learn to predict surface geometry from a single image
- Very rough models, much room for improvement

# Interpretation of indoor scenes

# Vision = assigning labels to pixels?

Vision = interpreting within physical space

# Physical space needed for affordance

Is this a good place to sit?

Could I stand over here?

Can I put my cup here?

Walkable path

# Physical space needed for recognition

Apparent shape depends  
strongly on viewpoint

# Physical space needed for recognition

# Physical space needed to predict appearance

# Physical space needed to predict appearance

# Key challenges

- How to represent the physical space?
  - *Requires seeing beyond the visible*
- How to estimate the physical space?
  - Requires simplified models
  - Requires learning from examples

# Our Box Layout

- Room is an oriented 3D box
  - Three vanishing points specify orientation
  - Two pairs of sampled rays specify position/size

# Our Box Layout

- Room is an oriented 3D box
  - Three vanishing points (VPs) specify orientation
  - Two pairs of sampled rays specify position/size

Another box consistent with the same vanishing points

# Image Cues for Box Layout

- Straight edges
  - Edges on floor/wall surfaces are usually oriented towards VPs
  - Edges on objects might mislead
- Appearance of visible surfaces
  - Floor, wall, ceiling, object labels should be consistent with box

# Box Layout Algorithm

1. Detect edges
2. Estimate 3 orthogonal vanishing points
3. Apply region classifier to label pixels with visible surfaces
  - Boosted decision trees on region based on color, texture, edges, position
4. Generate box candidates by sampling pairs of rays from VPs
5. Score each box based on edges and pixel labels
  - Learn score via structured learning
6. Jointly refine box layout and pixel labels to get final estimate

# Evaluation

- Dataset: 308 indoor images
  - Train with 204 images, test with 104 images

# Experimental results

Detected Edges

Surface Labels

Box Layout

Detected Edges

Surface Labels

Box Layout

# Experimental results

Detected Edges

Surface Labels

Box Layout

Detected Edges

Surface Labels

Box Layout

# Experimental results

- Joint reasoning of surface label / box layout helps
  - Pixel error: 26.5% → 21.2%
  - Corner error: 7.4% → 6.3%
- Similar performance for cluttered and uncluttered rooms

# Mini-Conclusions

- Can fit a 3D box to the rooms boundaries from one image
  - Robust to occluding objects
  - Decent accuracy, but still much room for improvement

# Using room layout to improve object detection

## Box layout helps

1. Predict the appearance of objects, because they are often aligned with the room
2. Predict the position and size of objects, due to physical constraints and size consistency

2D Bed Detection

3D Bed Detection with Scene Geometry

# Search for objects in room coordinates

Recover Room Coordinates

Rectify Features to Room Coordinates

Rectified Sliding Windows

# Reason about 3D room and bed space

## Joint Inference with Priors

- Beds close to walls
- Beds within room
- Consistent bed/wall size
- Two objects cannot occupy the same space

# 3D Bed Detection from an Image

True positives

False positives

# Generic boxy object detection

# Generic boxy object detection

# Generic boxy object detection

# Good localization in image doesn't mean good localization in 3D

2D Cuboid Detection

Floor Plan

# Refining 3D location

- Refit bounding box by detecting bottom edges of objects and furniture legs

# 3D Evaluation

Ground Truth

Estimate

Ground Truth

Estimate

# 3D Evaluation

## Precision-Recall for 3D Voxel Occupancy

## Precision-Recall for Floor Layout

# Mini-Conclusions

- Our simple room box layout helps detect objects by predicting appearance and constraining position
- We can search for objects in 3D space and directly evaluate on 3D localization

# Things to remember

- Objects should be interpreted in the context of the surrounding scene
  - Many types of context to consider
- Spatial layout is an important part of scene interpretation, but many open problems
  - How to represent space?
  - How to learn and infer spatial models?
  - Important to see beyond the visible
- Consider trade-off of abstraction vs. precision

# Next class: last day of class

- HW 5 returned
- Overview of vision
- Important open research problems
- Feedback / ICES forms
