

Welcome to ECE 313

- ECE 313 is a course on probability theory with
 - Some statistical applications
 - Some applications to selected problems in electrical and computer engineering
- ECE 313 is (semi)-required in the BSEE and BSCompE curricula

ECE 313 - Lecture 1 © 2000 Dilip V. Sarwate, University of Illinois at Urbana-Champaign, All Rights Reserved Slide 1 of 30

What does semi-required mean?

- All BSEE and BSCompE students must take **one** of the following three courses
 - ECE 313
 - Industrial Engineering 230
 - Statistics 310

ECE 313 - Lecture 1 © 2000 Dilip V. Sarwate, University of Illinois at Urbana-Champaign, All Rights Reserved Slide 2 of 30

How is ECE 313 different?

- ECE 313 is a course on
 - Mathematical probability theory
 - Applications to the statistical problems of
 - ◆ decision-making under uncertainty
 - ◆ estimation of parameters
 - Applications to problems in engineering
- IE 230 and Stat 310 primarily teach statistical methods

ECE 313 - Lecture 1 © 2000 Dilip V. Sarwate, University of Illinois at Urbana-Champaign, All Rights Reserved Slide 3 of 30

How does ECE 313 compare?

- The coverage of probability is more complete and in more depth in ECE 313 than in IE 230 or Stat 310
- The coverage of statistics in ECE 313 is idiosyncratic and incomplete compared to the broad coverage in IE 230 or Stat 310
- ECE 313 primarily covers some statistical techniques applicable to communications and radar systems

ECE 313 - Lecture 1 © 2000 Dilip V. Sarwate, University of Illinois at Urbana-Champaign, All Rights Reserved Slide 4 of 30

Why take ECE 313 and not others?

- ECE 313 is essential preparation for many senior-level and graduate courses in
 - communication systems
 - signal processing
 - computer networks
 - computer system analysis
 - reliability of systems
- IE 230 and Stat 310 will not prepare you as well for these courses

ECE 313 - Lecture 1 © 2000 Dilip V. Sarwate, University of Illinois at Urbana-Champaign, All Rights Reserved Slide 5 of 30

What can you do after ECE 313?

- Links to courses that have ECE 313 as a prerequisite can be found on the class web page at <http://www2.ece.uiuc.edu/~ece313/faq.html>
- You will be able to apply probabilistic reasoning to understand **how and why** various statistical procedures work

ECE 313 - Lecture 1 © 2000 Dilip V. Sarwate, University of Illinois at Urbana-Champaign, All Rights Reserved Slide 6 of 30

What is Probability?

- Since pre-historic times, Mankind has been aware of
 - Deterministic phenomena
 - ◆ daily sunrises and sunsets
 - ◆ tides at sea shores
 - ◆ phases of the moon
 - ◆ seasonal changes in weather
 - ◆ annual flooding of the Nile

ECE 313 - Lecture 1 © 2000 Dilip V. Sarwate, University of Illinois at Urbana-Champaign, All Rights Reserved Slide 7 of 30

What is Probability? (continued)

- Since pre-historic times, Mankind has also noticed
 - Random phenomena
 - ◆ results of coin tosses
 - ◆ results of rolling dice
 - ◆ results of horse races
- Legends and folk tales from all over the world refer to dice games and gambling

ECE 313 - Lecture 1 © 2000 Dilip V. Sarwate, University of Illinois at Urbana-Champaign, All Rights Reserved Slide 8 of 30

Gambling in ancient times

- The Babylonians, Chinese, Egyptians, Greeks, Persians, Romans, Vikings, the Aryans in ancient India, all gambled
- Aristotle discussed dice probabilities
- The Indian epic *The Mahabharata* tells of a dice game between rival clans in which one side uses **loaded** dice to gain an unfair advantage

ECE 313 - Lecture 1 © 2000 Dilip V. Sarwate, University of Illinois at Urbana-Champaign, All Rights Reserved Slide 9 of 30

Gambling in ancient times

- Curiously, the Old Testament does not include any mention of gambling — the New Testament does
- However, the Israelites were aware of probabilistic ideas
- **Choosing by lots, or casting lots**, i.e., making a **random choice** among all the possibilities, has been recognized from ancient times as a fair method

ECE 313 - Lecture 1 © 2000 Dilip V. Sarwate, University of Illinois at Urbana-Champaign, All Rights Reserved Slide 10 of 30

Gambling in modern times

- Modern mankind also loves to gamble
- Government prohibitions against gambling are disappearing
- Nowadays, governments even encourage gambling through
 - State-run lotteries
 - Casinos (possibly on riverboats)
 - Betting Parlors, etc

ECE 313 - Lecture 1 © 2000 Dilip V. Sarwate, University of Illinois at Urbana-Champaign, All Rights Reserved Slide 11 of 30

Probability in ordinary language

- Probabilistic notions are commonplace in everyday language usage
- We use words such as
 - probable/improbable; possible/impossible
 - certain/uncertain; likely/unlikely
- Phrases such as “there is a 50-50 chance” “the odds are 7 to 4 against” “the probability of precipitation is 20%” are **understood?** by most people

ECE 313 - Lecture 1 © 2000 Dilip V. Sarwate, University of Illinois at Urbana-Champaign, All Rights Reserved Slide 12 of 30

Common meanings of Probability

- What do most people understand about probabilities?
- What is the probability that a coin comes down Heads when it is tossed?
- Almost everyone answers $1/2$ Why $1/2$?
- “Because there are two sides to the coin”
- “Because when tossed repeatedly, the coin will turn up Heads half the time”

ECE 313 - Lecture 1 © 2000 Dilip V. Sarwate, University of Illinois at Urbana-Champaign, All Rights Reserved Slide 11 of 30

Classical Approach to Probability

- “The probability of Heads is $1/2$ because there are two sides to the coin”
- This is called the **classical approach to probability**
- More generally, if there are **n possible outcomes** of an experiment, then each outcome has probability $1/n$
- Justification: Symmetry principle; principle of indifference (or insufficient reason)

ECE 313 - Lecture 1 © 2000 Dilip V. Sarwate, University of Illinois at Urbana-Champaign, All Rights Reserved Slide 14 of 30

Problems with Classical Approach

- What exactly is an outcome?
- If we toss two coins, are there **three** outcomes or **four** outcomes?
 - {0 Heads, 1 Head, 2 Heads}?
 - {(T,T), (T,H), (H,T), (H,H)}?
- Note that 2 Heads has probability $1/3$ or $1/4$ depending on the choice
- “There are only two outcomes: either I win the Lottery, or I don't, so probability is $1/2$?”

ECE 313 - Lecture 1 © 2000 Dilip V. Sarwate, University of Illinois at Urbana-Champaign, All Rights Reserved Slide 15 of 30

Relative Frequency Approach

- “The probability of Heads is $1/2$ because when tossed repeatedly, the coin will turn up Heads half the time”
- How do you **know** that the coin **will** turn up Heads half the time?
- Suppose multiple tosses **have** resulted in 50% Heads. Setting $P(\text{Head}) = 1/2$ is the **relative frequency approach to probability**

ECE 313 - Lecture 1 © 2000 Dilip V. Sarwate, University of Illinois at Urbana-Champaign, All Rights Reserved Slide 16 of 30

Relative Frequency Approach

- If an outcome x occurs m times on N trials, its **relative frequency** is m/N and we **define** its probability $P(x)$ to be m/N
- Does there exist a probability of Heads for a mint-new **untossed** coin? Or do probabilities come into existence only after multiple tosses?
- How large should N be? Are probabilities re-defined after each toss?

ECE 313 - Lecture 1 © 2000 Dilip V. Sarwate, University of Illinois at Urbana-Champaign, All Rights Reserved Slide 17 of 30

Probability as beliefs

- Many assertions about probability are essentially statements of beliefs
- A **fair coin** is one for which $P(\text{Heads}) = 1/2$ but how do we **know** whether a given coin is fair?
- Symmetry of the physical object is a **belief**
- That further tosses of a coin for which $P(\text{Heads}) = 1/2$ **will** result in 50% Heads is a **belief**

ECE 313 - Lecture 1 © 2000 Dilip V. Sarwate, University of Illinois at Urbana-Champaign, All Rights Reserved Slide 18 of 30

Subjective Approach to Probability

- Statements about probabilities are statements about our beliefs
- Different persons can observe the same phenomenon and arrive at different beliefs
- Many bets on sporting events arise from differences in beliefs!
- Probabilities are often expressed in terms of **odds** in such cases

ECE 313 - Lecture 1 © 2000 Dilip V. Sarwate, University of Illinois at Urbana-Champaign, All Rights Reserved Slide 19 of 30

Subjective Approach to Probability

- **Odds** of m to n **against** an event means the probability of the event is $n/(n+m)$
- Odds describe payoffs from bets: if you bet $\$n$ that the event will occur, you will either **gain $\$m$** or **lose $\$n$**
- Over a long series of trials, your average gain will be zero
- Different assessments of the odds lead to the belief that one has an advantage

ECE 313 - Lecture 1 © 2000 Dilip V. Sarwate, University of Illinois at Urbana-Champaign, All Rights Reserved Slide 20 of 30

Probabilities as numbers

- We always use numbers in the range $[0,1]$ to denote probabilities
- Are probabilities merely numbers without any additional meaning ascribed to them?
- This is called the **axiomatic approach** to the **probability calculus**
- The axiomatic approach is consistent with all the approaches described above

ECE 313 - Lecture 1 © 2000 Dilip V. Sarwate, University of Illinois at Urbana-Champaign, All Rights Reserved Slide 21 of 30

Axiomatic Approach to Probability

- In the axiomatic approach, probabilities are numbers in the range $[0,1]$
- Certain probabilities are assumed to be given (we don't ask how!)
- The axiomatic approach allows the **calculation** of **other** probabilities in a mathematically and logically consistent manner
- It is a **probability calculus**

ECE 313 - Lecture 1 © 2000 Dilip V. Sarwate, University of Illinois at Urbana-Champaign, All Rights Reserved Slide 22 of 30

Axiomatic Approach to Probability

- The axiomatic approach allows the computation of probabilities without requiring philosophical discussions about the meaning of probability
- If you believe that probability is purely subjective, then the axiomatic approach tells you what **other** beliefs are **logically consistent** with your chosen beliefs

ECE 313 - Lecture 1 © 2000 Dilip V. Sarwate, University of Illinois at Urbana-Champaign, All Rights Reserved Slide 23 of 30

Axiomatic Approach to Probability

- The axiomatic approach to probability will be used throughout this course
- We will build a mathematical **model** of probabilities that will allow us to draw useful and interesting conclusions about the real world
- The model does not describe **all** aspects of probability but enough aspects are captured to make the model very useful

ECE 313 - Lecture 1 © 2000 Dilip V. Sarwate, University of Illinois at Urbana-Champaign, All Rights Reserved Slide 24 of 30

A homily about models

- How well does the model shown above describe a real resistor?
- Mathematical (or physical) models of real-world phenomena do not necessarily capture **all** the features of reality

ECE 313 - Lecture 1 © 2000 Dilip V. Sarwate, University of Illinois at Urbana-Champaign, All Rights Reserved Slide 25 of 30

What is/are Statistics?

- Statistics are collections of data
- Statistics is the science of
 - collecting data
 - organizing data
 - analyzing data
 - **making inferences from data**
- In this course, we shall study a few selected topics in **statistical inference**

ECE 313 - Lecture 1 © 2000 Dilip V. Sarwate, University of Illinois at Urbana-Champaign, All Rights Reserved Slide 26 of 30

Probability versus Statistics

- Probability theory deals with questions such as
"What is the probability that Heads shows six times on ten tosses of a **fair coin**?"
- Whether the coin actually is fair is not open to question — fairness is one of the givens in the problem
- The probability question can be answered precisely and unambiguously

ECE 313 - Lecture 1 © 2000 Dilip V. Sarwate, University of Illinois at Urbana-Champaign, All Rights Reserved Slide 27 of 30

Probability versus Statistics

- Statistical inference deals with questions such as
"Given that Heads showed on six of ten tosses, is it **reasonable** to **assume** the coin is fair?"
- A definitive answer is not possible since different people have different ideas as to what is reasonable

ECE 313 - Lecture 1 © 2000 Dilip V. Sarwate, University of Illinois at Urbana-Champaign, All Rights Reserved Slide 28 of 30

Probability versus Statistics

- Statistical inferences are accompanied by **levels of confidence**
- "Yes, I am 95% sure the coin is fair"
- "Yes, I am 99% sure the coin is fair"
- **NO** statistical procedure can **prove or disprove** that the coin is fair
- Fairness is a matter of belief, and the degree of belief is the confidence level

ECE 313 - Lecture 1 © 2000 Dilip V. Sarwate, University of Illinois at Urbana-Champaign, All Rights Reserved Slide 29 of 30

Summary

- Some elementary ideas of probability and statistics have been introduced at a fairly intuitive level
- Various approaches to probability have been described briefly
- The notion of statistical inference has been introduced
- But what does all this have to do with electrical and computer engineering?

ECE 313 - Lecture 1 © 2000 Dilip V. Sarwate, University of Illinois at Urbana-Champaign, All Rights Reserved Slide 30 of 30
