	ded spectrum			

The **spectrum** of x(t) is the set of frequencies, and their associated phasors,

Spectrum
$$(x(t)) = \{(f_{-N}, a_{-N}), \dots, (f_0, a_0), \dots, (f_N, a_N)\}$$

such that

$$x(t) = \sum_{k=-N}^{N} a_k e^{j2\pi f_k t}$$

0000				
Equilian	's theorem			

One reason the spectrum is useful is that **any** periodic signal can be written as a sum of cosines. Fourier's theorem says that any x(t) that is periodic, i.e.,

$$x(t+T_0)=x(t)$$

can be written as

$$x(t) = \sum_{k=-\infty}^{\infty} X_k e^{j2\pi k F_0 t}$$

which is a special case of the spectrum for periodic signals: $f_k = kF_0$, and $a_k = X_k$, and

$$F_0 = \frac{1}{T_0}$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ のQで

- Fourier Synthesis is the process of generating the signal, x(t), given its spectrum. Last lecture, you learned how to do this, in general.
- Fourier Analysis is the process of finding the spectrum, X_k , given the signal x(t). I'll tell you how to do that today.

Orthogon	ality			

Two functions f(t) and g(t) are said to be **orthogonal**, over some period of time T, if

$$\int_0^T f(t)g(t) = 0$$

▲□▶ ▲□▶ ▲目▶ ▲目▶ 目 のへで

Sine and Cosine are Orthogonal

For example, $sin(2\pi t)$ and $cos(2\pi t)$ are orthogonal over the period $0 \le t \le 1$:

▲□▶ ▲□▶ ▲臣▶ ★臣▶ = 臣 = のへで

Similarly, sinusoids at different frequencies are orthogonal over any time segment that contains an integer number of periods:

Suppose we have a signal that is known to be

$$x(t) = a\cos(2\pi 3t) + b\sin(2\pi 3t) + c\cos(2\pi 4t) + d\sin(2\pi 4t) + \dots$$

... but we don't know a, b, c, d, etc. Let's use orthogonality to figure out the value of b:

$$\int_0^1 x(t)\sin(2\pi 3t)dt = a \int_0^1 \cos(2\pi 3t)\sin(2\pi 3t)dt + b \int_0^1 \sin(2\pi 3t)\sin(2\pi 3t)dt + c \int_0^1 \cos(2\pi 4t)\sin(2\pi 3t)dt + e \int_0^1 \sin(2\pi 4t)\sin(2\pi 3t)dt + \dots$$

▲ロ ▶ ▲周 ▶ ▲ 国 ▶ ▲ 国 ▶ ● の Q @

... which simplifies to

$$\int_0^1 x(t) \sin(2\pi 3t) dt = 0 + b \int_0^1 \sin^2(2\pi 3t) dt + 0 + 0 + \dots$$

The average value of $\sin^2(t)$ is 1/2, so

$$\int_0^1 x(t)\sin(2\pi 3t)dt = \frac{b}{2}$$

If we **don't** know the value of *b*, but we **do** know how to integrate $\int x(t)\sin(2\pi 3t)dt$, then we can find the value of *b* from the formula above.

How to use orthogonality					

We still have one problem. Integrating $\int x(t) \cos(2\pi 4t) dt$ is hard—lots of ugly integration by parts and so on. What do we do?

9 Fourier Series: Instead of cosine, use complex exponential:

•

$$\int x(t)e^{-j2\pi ft}dt$$

That integral is still hard, but it's always easier than $\int x(t) \cos(2\pi 4t) dt$. It can usually be solved with some combination of integration by parts, variable substitution, etc.

Remember Fourier's theorem. He said that any periodic signal, with a period of T_0 seconds, can be written

$$x(t) = \sum_{k=-\infty}^{\infty} X_k e^{j2\pi kt/T_0}$$

What I want to do, now, is to prove that if you know x(t), you can find its Fourier series coefficients using the following formula:

$$X_k = \frac{1}{T_0} \int_0^{T_0} x(t) e^{-j2\pi kt/T_0} dt$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ のQで

0000	00000000	○0●0000		00
Fourier's	Theorem			

Remember Fourier's theorem. He said that any periodic signal, with a period of T_0 seconds, can be written

$$x(t) = \sum_{k=-\infty}^{\infty} X_k e^{j2\pi kt/T_0}$$

I'm going to find the formula for X_k using the following idea:

• Orthogonality: $e^{-j2\pi\ell t/T_0}$ is orthogonal to $e^{j2\pi kt/T_0}$ for any $\ell \neq k$.

Orthogonality: start with $x(t) = \sum_{k=-\infty}^{\infty} X_k e^{j2\pi kt/T_0}$, and multiply both sides by $e^{-j2\pi \ell t/T_0}$:

$$x(t)e^{-2\pi\ell t/T_0} = \sum_{k=-\infty}^{\infty} X_k e^{j2\pi(k-\ell)t/T_0}$$

Now integrate both sides of that equation, over any complete period:

$$\frac{1}{T_0}\int_0^{T_0} x(t)e^{-2\pi\ell t/T_0}dt = \sum_{k=-\infty}^{\infty} X_k \frac{1}{T_0}\int_0^{T_0} e^{j2\pi(k-\ell)t/T_0}dt$$

▲□▶ ▲□▶ ▲三▶ ▲三▶ 三三 のへで

Fourier's Theorem and Orthogonality

Now think really hard about what's inside that integral sign:

$$\frac{1}{T_0} \int_0^{T_0} e^{j2\pi(k-\ell)t/T_0} dt$$

= $\frac{1}{T_0} \int_0^{T_0} \cos\left(\frac{2\pi(k-\ell)t}{T_0}\right) dt$
+ $j\frac{1}{T_0} \int_0^{T_0} \sin\left(\frac{2\pi(k-\ell)t}{T_0}\right) dt$

If k ≠ l, then we're integrating a cosine and a sine over k-l periods. That integral is always zero.

• If
$$k = \ell$$
, then we're integrating

$$\frac{1}{T_0} \int_0^{T_0} \cos(0) dt + +j \frac{1}{T_0} \int_0^{T_0} \sin(0) dt = 1$$

So, because of orthogonality:

$$\frac{1}{T_0} \int_0^{T_0} x(t) e^{-2\pi\ell t/T_0} dt = \sum_{k=-\infty}^\infty X_k \frac{1}{T_0} \int_0^{T_0} e^{j2\pi(k-\ell)t/T_0} dt$$
$$= \dots + 0 + 0 + 0 + X_\ell + 0 + 0 + 0 + \dots$$
