#### 7 Summary

• A convolution is exactly the same thing as a weighted local average. We give it a special name, because we will use it very often. It's defined as:

$$y[n] = \sum_{m} g[m]f[n-m] = \sum_{m} g[n-m]f[m]$$

• We use the symbol \* to mean "convolution:"

$$y[n] = g[n] * f[n] = \sum_{m} g[m]f[n-m] = \sum_{m} g[n-m]f[m]$$

 $\bullet~\mbox{Tones}~\mbox{in}~\rightarrow~\mbox{Tones}~\mbox{out}$ 

$$\begin{aligned} x[n] &= e^{j\omega n} \to y[n] = G(\omega)e^{j\omega n} \\ x[n] &= \cos(\omega n) \to y[n] = |G(\omega)|\cos(\omega n + \angle G(\omega)) \\ x[n] &= A\cos(\omega n + \theta) \to y[n] = A|G(\omega)|\cos(\omega n + \theta + \angle G(\omega)) \end{aligned}$$

• where the Frequency Response is given by

$$G(\omega) = \sum_{m} g[m] e^{-j\omega m}$$

The **spectrum** of x(t) is the set of frequencies, and their associated phasors,

Spectrum 
$$(x(t)) = \{(f_{-N}, a_{-N}), \dots, (f_0, a_0), \dots, (f_N, a_N)\}$$

such that

$$x(t) = \sum_{k=-N}^{N} a_k e^{j2\pi f_k t}$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

#### 

One reason the spectrum is useful is that **any** periodic signal can be written as a sum of cosines. Fourier's theorem says that any x(t) that is periodic, i.e.,

$$x(t+T_0)=x(t)$$

can be written as

$$x(t) = \sum_{k=-\infty}^{\infty} X_k e^{j2\pi k F_0 t}$$

which is a special case of the spectrum for periodic signals:  $f_k = kF_0$ , and  $a_k = X_k$ , and

$$F_0 = \frac{1}{T_0}$$

### Review: Discrete-Time Fourier Series

Pure Delav

A signal that's periodic in discrete time also has a Fourier series. If the signal is periodic with a period of  $N_0 = T_0 F_s$  samples, then its Fourier series is

Example

Cascades

$$x[n] = \sum_{k=0}^{N_0-1} X_k e^{j2\pi kn/N_0} = \sum_{k=-N_0/2}^{(N_0-1)/2} X_k e^{j2\pi kn/N_0}$$

and the Fourier analysis formula is

Periodic Signals

Review

$$X_{k} = \frac{1}{N_{0}} \sum_{n=0}^{N_{0}-1} x[n] e^{-j2\pi kn/N_{0}}$$

### Example: Spectrum of a Square Wave

Pure Delav

Periodic Signals

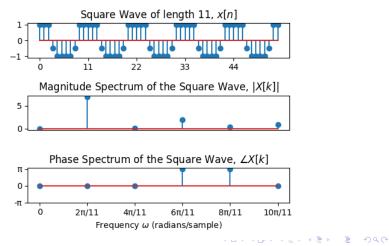

Review

0000000000

For example, here's an even-symmetric (x[n] = x[-n]), zero-DC  $(\sum_{n} x[n] = 0)$ , unit-amplitude  $(\max_{n} |x[n]| = 1)$  square wave, with a period of 11 samples:

 oooco

Notice that, for the phase spectrum of a square wave, the phase spectrum is either  $\angle X[k] = 0$  or  $\angle X[k] = \pi$ . That means that the spectrum is real-valued, with no complex part:

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ のQで

- Positive real: X[k] = |X[k]|
- Negative real:  $X[k] = -|X[k]| = |X[k]|e^{j\pi}$

Having discovered that the square wave has a real-valued X[k], we could just plot X[k] itself, instead of plotting its magnitude and phase:

 Response of a Filter when the Input is Periodic

Now we're ready to ask this question:

What is the output of a filter when the input, x[n], is periodic with period  $N_0$ ?

### Review Occorrection Periodic Signals Pure Delay Example Cascades Sum Correction Summary C

**9** Fourier Series: If the input is periodic, then we can write it as

$$x[n] = \sum_{k=-N_0/2}^{(N_0-1)/2} X_k e^{j2\pi kn/N_0}$$

**2** Frequency Response: If the input is  $e^{j\omega n}$ , then the output is

$$y[n] = H(\omega)e^{j\omega n}$$

Linearity (of convolution, and of frequency response): If the input is x<sub>1</sub>[n] + x<sub>2</sub>[n], then the output is

$$y[n] = y_1[n] + y_2[n]$$

# Review Periodic Signals Pure Delay Example Cascades Sum Summary Response of a Filter when the Input is Periodic Feriodic Feriodic Summary Summ

Putting all those things together, if the input is

$$x[n] = \sum_{k=-N_0/2}^{(N_0-1)/2} X_k e^{j2\pi kn/N_0}$$

... then the output is

$$y[n] = \sum_{k=-N_0/2}^{(N_0-1)/2} X_k H(k\omega_0) e^{j2\pi kn/N_0}$$

... where  $\omega_0 = \frac{2\pi}{N_0}$  is the fundamental frequency.

### 7 Summary

One thing we can do to a signal is to just delay it, by  $n_0$  samples:

$$y[n] = x[n - n_0]$$

Even this very simple operation can be written as a convolution:

$$y[n] = g[n] * x[n]$$

where the "filter," g[n], is just

$$g[n] = \delta[n - n_0] = \begin{cases} 1 & n = n_0 \\ 0 & \text{otherwise} \end{cases}$$

#### 7 Summary

What happens if we pass the input through two LSI systems, in cascade?

Suppose I pass the signal through filter g[n], then pass it through another filter, h[n]:

$$y[n] = h[n] * (g[n] * x[n]),$$

we get a signal y[n] whose spectrum is:

 $Y[k] = H(k\omega_0)G(k\omega_0)X[k]$ 

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ のQで

Notice that

$$Y[k] = H(k\omega_0)G(k\omega_0)X[k] = G(k\omega_0)H(k\omega_0)X[k]$$

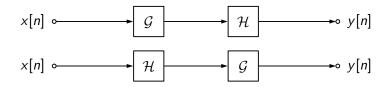

and therefore:

$$y[n] = h[n] * (g[n] * x[n]) = g[n] * (h[n] * x[n])$$

Here's what we get if we **difference** and then **delay** the square wave (hint: it's exactly the same as the previous slide!!)

# Review Periodic Signals Pure Delay Example Cascades Sum Summary Magnitude and Phase of Cascaded Frequency Responses

In general, when you cascade two LSI systems, the magnitudes multiply:

$$|Y_k| = |H(\omega)||G(\omega)||X_k|,$$

but the phases add:

$$\angle Y_k = \angle H(\omega) + \angle G(\omega) + \angle X_k$$

That's because:

 $H(\omega)G(\omega) = |H(\omega)|e^{j\angle H(\omega)}|G(\omega)|e^{j\angle G(\omega)} = |H(\omega)||G(\omega)|e^{j(\angle H(\omega) + \angle G(\omega)})|G(\omega)|e^{j(\angle H(\omega) + \angle G(\omega)})|G(\omega)|e^{j(\omega)})|G(\omega)|e^{j(\omega)}|G(\omega)|e^{j(\omega)})|G(\omega)|e^{j(\omega)}|G(\omega)|e^{j(\omega)})|G(\omega)|e^{j(\omega)}|G(\omega)|e^{j(\omega)})|G(\omega)|e^{j(\omega)}|G(\omega)|e^{j(\omega)})|G(\omega)|e^{j(\omega)}|G(\omega)|e^{j(\omega)})|G(\omega)|e^{j(\omega)}|G(\omega)|e^{j(\omega)})|G(\omega)|e^{j(\omega)}|G(\omega)|e^{j(\omega)})|G(\omega)|e^{j(\omega)}|G(\omega)|e^{j(\omega)})|G(\omega)|e^{j(\omega)}|G(\omega)|e^{j(\omega)}|G(\omega)|e^{j(\omega)})|G(\omega)|e^{j(\omega)}|G(\omega)|e^{j(\omega)}|G(\omega)|e^{j(\omega)}|G(\omega)|e^{j(\omega)})|G(\omega)|e^{j(\omega)}|G(\omega)|e^{j(\omega)}|G(\omega)|e^{j(\omega)}|G(\omega)$

### Local Average Filters

Review

Periodic Signals

Pure Delav

Let's go back to the local averaging filter. I want to define two different types of local average: centered, and delayed.

Example

Cascades

Sum

Centered local average: This one averages (<sup>L-1</sup>/<sub>2</sub>) future samples, (<sup>L-1</sup>/<sub>2</sub>) past samples, and x[n]:

$$y_{c}[n] = \frac{1}{L} \sum_{m=-\left(\frac{L-1}{2}\right)}^{\left(\frac{L-1}{2}\right)} x[n-m]$$

 Delayed local average: This one averages x[n] and L - 1 of its past samples:

$$y_d[n] = \frac{1}{L} \sum_{m=0}^{L-1} x[n-m]$$

Notice that  $y_d[n] = y_c \left[n - \left(\frac{L-1}{2}\right)\right]$ .

Suppose we define our pure delay filter,

Pure Delav

Periodic Signals

Review

$$g[n] = \delta \left[ n - \frac{L-1}{2} \right] = \begin{cases} 1 & n = \frac{L-1}{2} \\ 0 & \text{otherwise} \end{cases}$$

Using g[n], here are lots of different ways we can write the relationship between  $y_d[n]$ ,  $y_c[n]$ , and x[n]:

$$y_d[n] = f_d[n] * x[n]$$
  

$$y_c[n] = f_c[n] * x[n]$$
  

$$y_d[n] = g[n] * y_c[n] = g[n] * f_c[n] * x[n]$$
  

$$f_d[n] = g[n] * f_c[n]$$

The relationship between centered local average and delayed local average

Example

Cascades

Sum

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ のQで

Pure Delav

Remember the frequency response of a pure delay filter:

$$G(\omega) = e^{-j\omega\left(\frac{L-1}{2}\right)}$$

We have not yet figured out what  $F_c(\omega)$  and  $F_d(\omega)$  are. But whatever they are, we know that

$$f_d[n] = g[n] * f_c[n]$$

and therefore

Periodic Signals

$$F_d(\omega) = e^{-j\omega\left(\frac{L-1}{2}\right)}F_c(\omega)$$

Let's find the frequency response of

$$f_d[n] = egin{cases} rac{1}{L} & 0 \leq m \leq L-1 \ 0 & ext{otherwise} \end{cases}$$

The formula is

$$F_d(\omega) = \sum_m f[m] e^{-j\omega m},$$

SO,

$$F_d(\omega) = \sum_{m=0}^{L-1} \frac{1}{L} e^{-j\omega m}$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ のQで

$$F_d(\omega) = \sum_{m=0}^{L-1} \frac{1}{L} e^{-j\omega m}$$

This is just a standard geometric series,

$$\sum_{m=0}^{L-1} a^m = \frac{1-a^L}{1-a},$$

SO:

$$F_d(\omega) = rac{1}{L} \left( rac{1 - e^{-j\omega L}}{1 - e^{-j\omega}} 
ight)$$

## The frequency response of a local average filter

We now have an extremely useful transform pair:

Pure Delav

Review

Periodic Signals

$$f_d[n] = egin{cases} rac{1}{L} & 0 \leq m \leq L-1 \ 0 & ext{otherwise} \end{cases} \quad \leftrightarrow \quad F_d(\omega) = rac{1}{L} \left(rac{1-e^{-j\omega L}}{1-e^{-j\omega}}
ight)$$

Example

Cascades

Sum

Let's attempt to convert that into polar form, so we can find magnitude and phase response. Notice that both the numerator and the denominator are subtractions of complex numbers, so we might be able to use  $2j \sin(x) = e^{jx} - e^{-jx}$  for some x. Let's try:

$$\frac{1}{L}\left(\frac{1-e^{-j\omega L}}{1-e^{-j\omega}}\right) = \frac{1}{L}\frac{e^{-j\omega L/2}}{e^{-j\omega/2}}\left(\frac{e^{j\omega L/2}-e^{-j\omega L/2}}{e^{j\omega/2}-e^{-j\omega/2}}\right)$$
$$= e^{-j\omega\left(\frac{L-1}{2}\right)}\frac{1}{L}\left(\frac{2j\sin(\omega L/2)}{2j\sin(\omega/2)}\right)$$
$$= e^{-j\omega\left(\frac{L-1}{2}\right)}\frac{1}{L}\left(\frac{\sin(\omega L/2)}{\sin(\omega/2)}\right)$$

# Review Periodic Signals Pure Delay Example Cascades Sum Summary 0000 0000 0000 00000 00000 00000 0000 0000 The frequency response of a local average filter

Now we have  $F_d(\omega)$  in almost magnitude-phase form:

$$f_d[n] = \begin{cases} \frac{1}{L} & 0 \le m \le L - 1\\ 0 & \text{otherwise} \end{cases} \quad \leftrightarrow \quad F_d(\omega) = \left(\frac{\sin(\omega L/2)}{L\sin(\omega/2)}\right) e^{-j\omega(\frac{L-1}{2})}$$

By the way, remember we discovered that

$$f_d[n] = g[n] * f_c[n] \quad \leftrightarrow \quad F_d(\omega) = e^{-j\omega\left(\frac{L-1}{2}\right)}F_c(\omega)$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ のQで

Notice anything?

The textbook calls this function the "Dirichlet form:"

$$D_L(\omega) = rac{\sin(\omega L/2)}{\sin(\omega/2)}$$

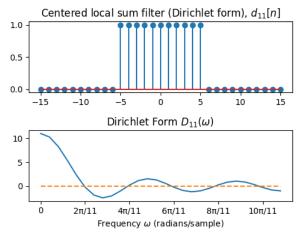

That is, exactly, the frequency response of a centered local sum filter:

$$d_{L}[n] = \begin{cases} 1 & -\left(\frac{L-1}{2}\right) \le n \le \left(\frac{L-1}{2}\right) \\ 0 & \text{otherwise} \end{cases}$$

▲ロ ▶ ▲周 ▶ ▲ 国 ▶ ▲ 国 ▶ ● の Q @

Here's what it looks like:

▲□▶ ▲圖▶ ▲匡▶ ▲匡▶ ― 匡 … のへで

#### 

Since every local averaging filter is based on Dirichlet form, it's worth spending some time to understand it better.

$$D_L(\omega) = rac{\sin(\omega L/2)}{\sin(\omega/2)}$$

• It's equal to zero every time  $\omega L/2$  is a multiple of  $\pi$ . So

$$D_L\left(\frac{2\pi k}{L}\right) = 0$$
 for all integers  $k$  except  $k = 0$ 

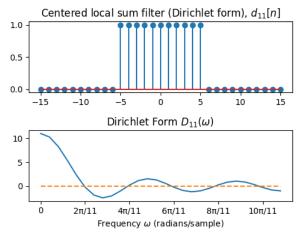

• At  $\omega = 0$ , the value of  $\frac{\sin(\omega L/2)}{\sin(\omega/2)}$  is undefined, but it's posssible to prove that  $\lim_{\omega \to 0} D_L(\omega) = L$ . To make life easy, we'll just define it that way:

DEFINE:  $D_L(0) = L$

Here's what it looks like:

▲□▶ ▲□▶ ▲三▶ ▲三▶ 三三 のへで

Here's what the centered local averaging filter looks like. Notice that it's just 1/L times the Dirichlet form:

- 2 Response of a Filter when the Input is Periodic
- 3 A Pure-Delay "Filter"
- 4 Example: Delaying a Square Wave
- 5 Cascaded LSI Systems
- 6 The Running-Sum Filter (Local Averaging)

#### **O** Summary

# Review Periodic Signals Pure Delay Example Cascades Sum conconcence of Systems in General

• Periodic inputs: If the input of an LSI system is periodic,

$$x[n] = \sum_{k=-N_0/2}^{(N_0-1)/2} X_k e^{j2\pi kn/N_0}$$

... then the output is

$$y[n] = \sum_{k=-N_0/2}^{(N_0-1)/2} X_k H(k\omega_0) e^{j2\pi kn/N_0}$$

• **Cascaded LTI Systems** convolve their impulse responses, equivalently, they multiply their frequency responses:

$$y[n] = h[n] * g[n] * x[n], \quad Y_k = H(k\omega_0)G(k\omega_0)X_k$$

## Summary: Types of LSI Systems

Periodic Signals

Review

• The Pure Delay Filter has  $|G(\omega)| = 1$ ,  $\angle G(\omega) = -\omega n_0$ :

Example

$$g[m] = \delta[n - n_0] \quad \leftrightarrow \quad G(\omega) = e^{-j\omega n_0}$$

Cascades

Sum

Summary

• The **Centered Local Averaging Filter** is 1/*L* times the Dirichlet form:

$$f_c[n] = \begin{cases} \frac{1}{L} & -\left(\frac{L-1}{2}\right) \le n \le \left(\frac{L-1}{2}\right) \\ 0 & \text{otherwise} \end{cases} \quad \leftrightarrow \quad F_c(\omega) = \frac{\sin(\omega L/2)}{L\sin(\omega/2)}$$

• The **Delayed Local Averaging Filter** is  $f_c[n]$ , delayed by half of its length:

$$f_d[n] = \begin{cases} \frac{1}{L} & 0 \le n \le L - 1\\ 0 & \text{otherwise} \end{cases} \quad \leftrightarrow \quad F_d(\omega) = \frac{\sin(\omega L/2)}{L\sin(\omega/2)} e^{-j\omega(\frac{L-1}{2})}$$
