Module 6: Nuclear Arsenals
Why North Korea might not be bluffing about its nuclear plans

Skeptics have dismissed the threat posed by Pyongyang’s weapons programme but the regime has a track record of getting there – eventually

Eric Talmadge for AP
Tuesday 15 March 2016 08:54 EDT

Skeptics of North Korea’s nuclear threat, and there are many, have long clung to two comforting assurances.

While the North has the bomb, it doesn’t have a warhead small enough to put on a long-range rocket. And it certainly doesn’t have a re-entry vehicle to keep that warhead from burning up in the atmosphere before it could reach threatened targets, for example Manhattan.

But today North Korea suggested it would soon be ready to show the world it has mastered both technologies.

“We have proudly acquired the re-entry technology, possessed by a few countries styling themselves as military powers,” said North Korean leader Kim Jong-un in state-run media.

The authoritarian leader was said to have made the comment after meeting scientists and technicians following, what it claimed, was a successful test of a re-entry vehicle.

Kim ordered preparations for a “nuclear warhead explosion test” and test firings of “several kinds of ballistic rockets able to carry nuclear warheads,” the report added.
Odisha: India successfully test-fires nuclear-capable Agni-I missile

March 14, 2016 16:24 IST
By Neha Singh

India succeeded in test-firing a nuclear-capable Agni-I missile from Abdul Kalam Island, earlier known as Wheeler Island, off the coast of Odisha Monday. The indigenously built missile is capable of hitting a target at a range of 700 kms.

The medium-range surface-to-surface ballistic missile was test-fired at around 9:15 a.m, from the Integrated Test Range as part of Strategic Forces Command of Indian Army's training exercise. The missile hit the target in 9 minutes and 36 seconds, the Press Trust of India reported.

DRDO had successfully test-fired Agni-I missile in November 2015 and a month later it test-fired long-range nuclear-capable surface-to-surface Agni-IV missile.

There are three Agni missiles variants — medium-range ballistic missile (Agni-I), intermediate-range ballistic missile (Agni-II, Agni-III, Agni-IV) and inter-continental ballistic missile (Agni-V, Agni VI).

While Agni-II and Agni-III are operational, Agni-V is in the last phase of testing and Agni-VI is in the early stages of development. Agni-V, capable of striking targets 8,000 km away, can be launched from anywhere and Agni-VI, which has a strike-range of 10,000 km, can be deployed on submarines as well as land-based launchers.

The Agni-I missile’s sophisticated navigation system ensures it hits the target with a high degree of accuracy and precision, according to reports. The missile weighs 12 tonnes and can carry a conventional payload of 1,000 kg or a nuclear warhead.

India, Pakistan, Israel and North Korea

Part 4: Threat Perceptions
Module 6: Programs and Arsenals

Part 1: Overview of Programs and Arsenals
Module 6: Nuclear Arsenals and Proliferation

A Chain Reaction of Proliferation

"The Nuclear Express," a new book on the history of the atomic age, describes the interlocking web of influence and espionage behind the proliferation of nuclear technology. This diagram gives a summary of the authors' tracking of the transfers of nuclear technology and secrets.

Nuclear states
Circles represent nuclear states, arranged on the timeline by the year of first nuclear detonation (or, for Israel and South Africa, the year they could have tested).

Connections show the flow of information and technology, by intended transfer, leak or espionage. Some were one-way transfers, others were two-way.

Sources: Thomas C. Reed and Danny B. Stillman

This article has been revised to reflect the following correction:

Correction: December 15, 2008
A chart last Tuesday with an article about the proliferation of the atomic bomb, showing the exchange of nuclear information and technology between countries, misidentified the type of reactor that India acquired from Canada, which allowed India to make fuel for its first nuclear test. It was a CIRUS reactor, not a CANDU reactor.
World Nuclear Weapon Stockpiles 1945–2014

Rising, then Pulling Back from a Peak
Having reached a peak in the late 1980s, the number of nuclear warheads has dropped significantly. But more countries now possess them.

</tbody>
</table>

\(^a\) This includes warheads in the military stockpile assigned to nuclear forces. Additional warheads are in storage awaiting dismantlement. The United States and Russia each have several thousand warheads in this category.

\(^b\) Warheads are considered on alert if they are deployed on a delivery system that is deployed and ready to launch within minutes or hours.

\(^c\) Although deployed and fully operational, SLBMs on French and British SSNs are thought to require longer preparation to launch than US and Russian alert weapons.

U.S. and Russian “Tactical” Weapons in Europe

• The U.S. is thought to have 150 – 240 “tactical” nuclear weapons based in Europe, in the form of aerial bombs.

• Most are based in Italy and Turkey, but some are based in Germany, Belgium, and the Netherlands.

• Russia is thought to have about 2,000 operational “tactical” nuclear weapons in its arsenal.
The long-standing position of Washington is that its air-to-surface weapons in Europe connect the security of NATO and the United States. Still, the tactical arms are not intended for use against any particular nation and the infrastructure required to employ the weapons no longer stands at combat readiness.

A December 2008 report by an advisory panel to the U.S. Defense Department found that the time required to bring the aircraft that would fire the nuclear weapons into battle mode was "now measured in months rather than minutes."

The report detailed different views within the alliance, with some high-level U.S. officials at NATO headquarters in Belgium described as not being supportive of keeping the tactical weapons in Europe. An anonymous U.S. general was quoted to say that the nuclear bombs were no longer required as Washington could extend its nuclear umbrella to cover European allies from outside the continent.

- SLBM: submarine-launched ballistic missile
- SLCM: submarine-launched cruise missile

* All B61-11 and B83-1 bombs are inactive.
** Presidential Decision Directive 64 of November 29, 2000, authorized deployment of 490 (6+4) percent of 1,611 bombs in Europe. Whether the full number was deployed is unclear. Since 2000, the United States withdrew weapons from two former nuclear bases (Aviano in Italy and Neumuenster in Germany) and placed all B61-12s in the inactive stockpile.
Obama Limits When U.S. Would Use Nuclear Arms

By DAVID E. SANGER and PETER BAKER

WASHINGTON — President Obama said Monday that he was revamping American nuclear strategy to substantially narrow the conditions under which the United States would use nuclear weapons.

But the president said in an interview that he was carving out an exception for “outliers like Iran and North Korea” that have violated or renounced the main treaty to halt nuclear proliferation.
The document to be released Tuesday after months of study led by the Defense Department will declare that “the fundamental role” of nuclear weapons is to deter nuclear attacks on the United States, allies or partners, a narrower presumption than the past. But Mr. Obama rejected the formulation sought by arms control advocates to declare that the “sole role” of nuclear weapons is to deter a nuclear attack.

“We are going to pursue opportunities for further reductions in our nuclear posture, working in tandem with Russia but also working in tandem with NATO as a whole,” he said.

An obvious such issue would be the estimated 200 tactical nuclear weapons the United States still has stationed in Western Europe. Russia has called for their removal, and there is growing interest among European nations in such a move as well. But Mr. Obama said he wanted to consult with NATO allies before making such a commitment.

- **Submarines/surface ships/air**: SLCM, ASW, SAM, ASM, DB, torpedoes

#### SUBTOTAL NONSTRATEGIC AND DEFENSIVE FORCES

~2,000

### TOTAL

~4,600

---

1. The Sineva probably carries at least four MIRVed warheads. U.S. intelligence in 2006 estimated that the missile can carry up to 10 warheads.
2. All Gorgon missiles apparently have been removed from the ABM system.
3. We estimate that an additional 3,300 nonstrategic warheads are in reserve or awaiting dismantlement, leaving a total inventory of approximately 5,300 nonstrategic warheads.
4. We estimate that an additional 7,300 intact warheads are in reserve or awaiting dismantlement, for a total inventory of approximately 12,000 warheads.
Recent Evolution of Russian Nuclear Forces

Evolution of Russian total warheads is very similar to the evolution of US nuclear forces (because of START and New START limits).

Unlike the US, for geopolitical reasons Russia deploys more warheads on its ICBMs than on its SLBMs.
Plan for This Session

Midterm grades before the end of the week

RE4v1 due Thursday March 31st

RPv1 will be due Thursday April 7th

News and Discussion

Module 6: Nuclear Arsenals (cont’d)
The recent attacks in Belgium and elsewhere would have been catastrophic if the terrorists had gotten their hands on nuclear weapons or even a primitive “dirty bomb,” which combines nuclear material with conventional explosives. International efforts to prevent access to such weapons have made significant progress in recent years, but there is still a long way to go.

The Nuclear Security Summit, started by President Obama in 2010, aims to address this problem by encouraging governments to secure and eliminate weapons-usable nuclear materials. The fourth of these meetings begins Thursday in Washington, with more than 50 world leaders, including President Xi Jinping of China, expected to attend, though not President Vladimir Putin of Russia.
In the last six years, such meetings have persuaded 14 countries and Taiwan to give up their weapons-usable plutonium and highly enriched uranium. Twelve others, including France, Russia and the United States, have decreased their stockpiles of nuclear materials. Many states have made nuclear-related facilities more secure and have strengthened cooperation against nuclear smuggling. Nuclear detection equipment has been installed at more than 300 international border crossings, airports and seaports.

But progress is slow, even though the need for enhanced protections has become more urgent, given the concerns that terrorist groups are seeking nuclear technology. More than 1,800 metric tons of nuclear material remain stored in 24 countries, much of it vulnerable to theft, according to former Senator Sam Nunn, co-chairman of the Nuclear Threat Initiative, a nonprofit advocacy group. An increasing number of countries are pursuing nuclear energy projects, even though they lack the legal, regulatory and security frameworks to ensure that such programs, designed to produce power, not weapons, are protected, he said.

2016 Progress report from the Nuclear Threat Initiative
⇒ Progress has slowed ⇒ assessed risk from sabotage on nuclear facilities
China’s Nuclear Infrastructure

Lop Nur Nuclear Weapon Test Site Also possible site of nuclear weapon stockpiles.

Northwest Nuclear Weapon Research and Design Academy (Qinghai Academy)

Guangyuan Site of China’s largest plutonium production reactor and plutonium separation (reprocessing) plant. Facilities are not thought to be producing fissile material.

Heping Site of gaseous diffusion uranium enrichment plants can produce between 750 and 2,950 kg of weapons-grade uranium per year.

Possible warhead assembly and production facility

Headquarters of the North Sea Naval Fleet Probable location of China’s Xue chiao ballistic missile nuclear submarine.

Shanghai Institute of Nuclear Research Engaged in ballistic missile and nuclear weapon development.

Chinese Academy of Engineering Physics This is a duplicate of the nuclear weapon research and design facility at Haiguan.

Nuclear Fuel Component Plant Used for producing and processing plutonium for nuclear weapons.

Total Chinese Nuclear Warheads vs Time

North Korea < 10

Israel ~ 80

Pakistan ~ 120

India ~ 110
Khan Research Laboratory–Kahuta
Large-scale uranium enrichment plant designed to produce enough weapons-grade uranium for a number of nuclear devices per year; not subject to IAEA inspection.

Possible uranium enrichment R&D facility/pilot plant; not subject to IAEA inspection.

Pakistani Institute of Nuclear Science and Technology (PINSTECH)
Laboratory and pilot-scale plant for plutonium extraction: not subject to IAEA inspection. PARR-1 (9 MWt) and PARR-2 (30 KWt) research reactors, subject to IAEA safeguards.

Missile production factory

Pakistan Institute of Nuclear Science and Technology (PINSTECH)

- Large plutonium extraction plant; civil works complete; not subject to IAEA inspection. Chinese-sourced 300-MWe nuclear power reactor operational; subject to IAEA inspection. Additional 310-MWe nuclear power reactor planned.

Cardan-supplied KANUPP nuclear power reactor; subject to IAEA inspection.

Possible Prithvi missile storage facility

40-50 MWt research and plutonium production reactor operational; not subject to IAEA inspection. In conjunction with the nearby large plutonium extraction plant at Chasma and the pilot-scale plant at Rawalpindi, the reactor could be the source of a significant inventory of unsafeguarded weapon-useable plutonium.

M-11 storage facility

Italicized names represent nuclear-related sites. See table 11.1

Natra 1 and 2, and Kakrapar 1 and 2 nuclear power reactors, not subject to IAEA inspection and therefore available to produce plutonium for nuclear weapons.

Natra 1 and 2, and Kakrapar 1 and 2 nuclear power reactors, not subject to IAEA inspection and therefore available to produce plutonium for nuclear weapons.

Kudankulam India and Russia have signed an agreement to construct two 1,000-MWe civilian nuclear power reactors at this site, subject to IAEA safeguards.
India’s Nuclear and Missile Programs – 1

India’s nuclear weapons use plutonium

• India’s first nuclear explosive device used explosive material diverted illegally from a civilian nuclear reactor provided by Canada

• Estimated to have produced 225–370 kg of weapons-grade plutonium

• Estimated to have produced a smaller, but publicly unknown, quantity of weapons-grade uranium

• This quantity of plutonium is thought to be enough for India to produce ~50-90 nuclear weapons

• The FAS estimates that India has about 110 warheads

• India is thought to have the components to deploy a small number of nuclear weapons within days

• No nuclear weapons are known to be deployed among active military units or deployed on missiles

Local time is 5 and one-half hours later than GMT

* The Indian government announced that three nuclear devices were detonated simultaneously in two shafts, about one kilometer apart. We count this as two tests.

** Seismic records do not discriminate the explosions of two devices (announced by Indian scientists as being 0.2 kt and 0.6 kt), one or both of which may not have detonated.

Source: NRDC
India’s nuclear delivery capability

• India has developed several types of ballistic missiles capable of carrying and delivering a nuclear payload

• Three versions of the short-range, liquid-propellant, road-mobile Prithvi have been developed —
  — Army (range = 150 km, payload = 500 kg)
  — Air Force (range = 250 km, payload = 500–750 kg)
  — Navy (range = 350 km, payload = 500 kg)

• India has developed and successfully tested 3 medium range missiles Agni I-III, with a declared range of up to 3,000 km. The payload for the Agni III missile is assumed to be 1.5 tons.

• Longer range missiles Agni IV and V are under development.

• Prior to 2010 the main delivery vehicles were bomber planes

Pakistan’s Nuclear and Missile Programs – 1

Pakistan’s current nuclear weapons mainly use HEU

- Pakistan stole uranium enrichment technology from Urenco; has since supplied it to many other countries of concern
- Is estimated to have produced 585–800 kg of highly enriched uranium
- FAS estimates that it could have 120 HEU nuclear weapons
- May possess enough weapon-grade plutonium to produce 3–5 nuclear weapons
- Nuclear weapons are thought to be stored in component form, with the fissile core stored separately from the non-nuclear explosives
- Thought to possess enough components and material to assemble a small number of nuclear weapons in a matter of hours or days

Pakistan’s Nuclear and Missile Programs – 3

Pakistan’s nuclear delivery capability

• Thought to have about 30 nuclear-capable short-range Chinese M-11 surface-to-surface missiles, which have a range of 280–300 km

• Announced deployment of the Shaheen I in 2001

• Tested Ghauri I (range > 1,300 km, payload = 700 kg)

• Tested Ghauri II (range = 2,000 km, payload = 850 kg)

• Displayed but never tested the 2,000-km Shaheen II

• Primary nuclear capable aircraft is the F-16, which can deliver a 1,000-kg bomb to a distance of 1,400 km
Pakistani Nuclear Forces (2009)

We estimate that Pakistan has produced 70-90 nuclear warheads that can be deployed on the following delivery vehicles:

Pakistani Ra’ad Air-Launched Cruise Missile
Summary of India’s and Pakistan’s Ballistic Missile Systems

With India and Pakistan both possessing nuclear weapons and the means to deliver them great distances, a possible war could result in millions of deaths in both countries. The following illustrates the range of missiles:

Source: CNN (May 2003)
Israel’s Nuclear Weapons Complex

Negev Nuclear Research Center
Dimona is the location of Israel's nuclear weapon program, including plutonium production using IRR 2 research reactor (40-150 MWt) and associated plutonium extraction plant; and related uranium purification, uranium conversion, and fuel fabrication facilities. Site of small-scale laser and centrifuge uranium enrichment programs and discontinued lithium-6 and lithium deuteride production activities. No activities at Dimona are subject to IAEA inspection.
Israel’s nuclear weapons primarily use Pu

• Is thought to have completed its first nuclear device by late 1966 or early 1967, probably using HEU stolen from the United States.

• Is reported to have hurriedly assembled deliverable devices just before the 1967 six-day war.

• Is estimated to have produced ~ 400–700 kg of weapons-grade plutonium.

• Is thought to have enough plutonium to fabricate ~ 100–200 nuclear weapons.

• Is thought to have ~ 75–200 fission weapons, FAS estimate: 80. (Some sources disagree, claiming much more capability, including modern thermonuclear weapons.)
Israel’s nuclear delivery capability

- Jericho II: medium-range, solid-propellant (range = 1,500 km, payload = 1,000 kg). Developed with the French. Deployed in 1990; currently has ~100. Land- and rail-mobile.

- Jericho III: intermediate-range, solid-propellant (range approx. 4,000 km, payload = 1,000 kg). Indigenous. Tested.

- Israel could also deliver nuclear weapons using its U.S.-supplied F-4E and F-16 aircraft.

- Israel could also deliver nuclear weapons using its cruise missiles (the U.S.-supplied Harpoon, range = 120 km, payload = 220 kg, or a new 1,200-km cruise missile).
Summary of Israel’s Nuclear Delivery Systems

Yongbyon Nuclear Research Center  Site of a 5-MWe experimental nuclear power reactor;* a partially completed plutonium extraction facility;* a fuel fabrication plant;* fuel storage facilities;* and a Soviet-supplied IRT research reactor** and critical assembly.** 50-MWe power reactor previously under construction.

Under the Oct. 21, 1994, U.S.-North Korean Agreed Framework, activities at the 5-MWe gas-graphite reactor, the fuel fabrication facility, and the reprocessing plant have been frozen; construction also has been halted on the 50-MWe gas-graphite reactor. U.S. intelligence agencies believe that North Korea has used the 5-MWe reactor and extraction plant to produce plutonium (possibly enough for 1 or 2 nuclear weapons). Wastes from the extraction process are believed to be stored at two undeclared sites near the center.

200-MWe nuclear power reactor; construction halted under U.S.-N.K. Agreed Framework.

Uranium concentrate production plant, using ore from Sunchon-Wolbingson mine (50 km to the south).

Yellow Sea

Hwaedae-Gun missile testing range and production facilities.

Site of two 1,000-MWe, light-water reactors financed by KEDO according to the terms of the Agreed Framework; construction began in August 1997.

Uranium mining, and uranium concentrate production plant.

Subcritical assembly. Soviet-supplied laboratory-scale hot cells, which may have been used to extract small quantities of plutonium. (Similar cells may exist at other locations.)

* Subject to IAEA safeguards as of May 1992 and pursuant to North Korea’s obligations under the Non-Proliferation Treaty (NPT); future application of safeguards uncertain.

** Under IAEA safeguards pursuant to NPT obligations and a trilateral USSR-North Korean-IAEA agreement.
North Korea’s Nuclear Program – 1

History —

• 1950s: NK nuclear research reportedly begins.

• At this time NK was a Soviet Client state and its nuclear engineers were largely trained at Soviet scientific institutes.

• 1965: NK begins operating a small research reactor it received from the USSR.

• mid-1980s: Concerns over NK’s nuclear weapons program grow when US intelligence satellites reportedly photograph construction of a research reactor and the beginnings of a reprocessing facility at Yongbyon.
History (cont’d) —

- 1985 April: NK accedes to the NPT after a concerted sales effort by the USSR, which hopes to sell light-water reactors (LWRs) to NK for electrical power generation. These are never built, in part due to the collapse of the Soviet Union.

- 1986: NK publicly makes withdrawal of US nuclear weapons from SK a condition of its completion of the safeguard agreement required by the NPT, completes negotiation of the safeguard agreement with the IAEA within 18 months after acceding to the NPT, as the NPT requires.

- 1991: US signals it will withdraw its nuclear weapons from SK as part of its global return of tactical nuclear weapons to United States territory. (The United States had stationed a large number — sometimes more than 700 — nuclear weapons in SK as part of its alliance with SK and its Cold War strategy of flexible response to a possible attack by the USSR or its allies.)
History (cont’d) —

• 1989: NK is reported to have shut down its main research and plutonium production reactor for approximately 100 days.

• The US Intelligence Community judges that this was enough time for NK to extract enough nuclear material to build a nuclear device and to refuel the entire reactor.

• Neither the US nor any other country takes any direct action in response to this development.

• Instead, the international community presses NK to join the NPT and come into full compliance with its obligations under the NPT and makes this a condition for further progress on diplomatic issues.

• NK is believed to have extracted enough Pu for 1 or 2 nuclear bombs.

Source: NRDC (April 2003)
History (cont’d) —

- 1992 April 9: NK finally approves its NPT safeguard agreement.

- 1992 May: Inspections to verify the accuracy of NK’s initial declaration begin. NK informs the IAEA it conducted a one-time Pu extraction experiment on “damaged” fuel rods removed from the reactor at Yongbyon in 1989 but extracted only 90 grams of Pu (< 1/40 of the amount needed to produce a nuclear device).

- IAEA chemical analysis indicates NK had separated plutonium in four campaigns over a 3-year period beginning in 1989 and that NK possesses more Pu than it had declared to the IAEA or to the international community.

- 1993: NK announces it is withdrawing from the NPT.

- 1994: US threatens war with NK. President Carter flies to NK and negotiates a nuclear agreement to avoid war.
### Key Elements of the 1994 Agreed Framework

North Korea’s Nuclear Program – 6

History (cont’d) —

• 1994 October: The US and NK sign the 1994 Agreed Framework. A key goal of the Agreed Framework is for NK to replace its indigenous gas-graphite reactors with imported LWRs, which are good for electrical power generation but less useful for making bomb material.

• 1994 November: The new Republican majority in the US Congress rejects the Agreed Framework and refuses to fund its execution.

• 1994–1998: Execution of the Agreed Framework is plagued with political and technical problems and fails to make much progress.

• 1998 August: NK launches a 3-stage Taepo Dong-1 rocket with a range of 1,500–2,000 km; 3rd stage explodes at ignition.

• 1999 September: NK agrees to a moratorium on testing of long-range missiles as long as arms talks with the US continue.
History (cont’d) —

- 2000 October: US and NK issue Joint Communique:
  - Neither government has hostile intent toward the other.
  - Both commit to building a new relationship free from past enmity.

- 2000 October: NK states that it will not further test the Taepo Dong-1 missile; President Clinton announces he will travel to NK.

- 2000 December: Clinton announces he will not leave US to travel to NK during the constitutional crisis created by the Presidential election dispute; time runs out.
History (cont’d) —

- Secretary of State Colin Powell says President Bush will continue the engagement with NK currently in progress.

- 2001 June: President Bush announces desire for “serious discussions” with NK.

- 2002 January (post 9-11): President Bush labels NK part of “an axis of evil”.

- 2002 October: Visiting US official publicly challenges NK, US claims NK has uranium enrichment effort that violates the 1994 Agreed Framework.

- 2002 November: KEDO (Korean Energy Development Organization) consortium suspends fuel oil deliveries to NK, alleging NK has violated the Agreed Framework.
History (cont’d) —

• 2002 December: NK announces it is restarting its reactor because US violated the Agreed Framework, ends its cooperation with the IAEA, orders inspectors out.

• 2003 January: NK announces it is withdrawing from the NPT.

• 2004: NK tells visiting US experts it has separated the Pu in the spent reactor fuel at Yongbyon and is making nuclear weapons, shows “Pu” to visiting experts. NK is believed to have extracted 24–42 kg of Pu, enough for 6–12 nuclear bombs.

• 2006 October 9: NK tests a Pu nuclear explosive device.

• 2007 February 28: New 6-party agreement announced (see separate slide).

• 2009 April 5: NK launches a long-range rocket, is condemned by the UN, announces it will build its own LWR without outside help.

• 2009 May 25: NK tests a second nuclear explosive device.
Six-Party Agreement (2007 Feb 28)

An important first step toward complete, verifiable, and irreversible denuclearization of the Korean peninsula and the establishment of a more stable, peaceful, and prosperous Northeast Asia.

The D.P.R.K. agreed that it will, within 60 days:

- Shut down and seal Yongbyon nuclear facility for eventual abandonment
- Invite IAEA to conduct necessary monitoring and verifications
- Discuss with the other parties a list of all its nuclear programs, including plutonium extracted from used fuel rods, that would be abandoned

The other Parties agreed that they will:

- Provide emergency energy assistance to North Korea in the initial phase
- Make an initial shipment of emergency energy assistance equivalent to 50,000 tons of heavy fuel oil (HFO) within the first 60 days of the agreement

Five working groups will be established to carry out initial actions and formulate specific plans to implement the agreement, leading to a denuclearized D.P.R.K. and a permanent peace.
History (cont’d) —

- 2011 Dec 17: Kim Jong-un ascends to Supreme Leader of NK
- 2012 Feb 29: NK agrees to freeze nuclear program in exchange for energy and food relieve.
- 2012 Apr. 12: Unsuccessful NK missile test leads to cancellation of food and energy relieve agreement.
- 2012 May 4: Reports that NK has resumed construction of LWR for Pu production at Yongbyon.
- 2012 Dec. 12: Successful test of long range missile launching satellite into orbit
- 2013 Feb. 12: NK tests third nuclear explosive device.
- 2016 Jan. 6: NK tests fourth nuclear war head, 7-9kt, claimed thermo nuclear device
- 2016 Feb. 7: NK tests long range missile launching a satellite into orbit.
North Koreans Agree to Freeze Nuclear Work; U.S. to Give Aid

By STEVEN LEE MYERS and CHOE SANG-HUN

WASHINGTON — North Korea announced on Wednesday that it would suspend its nuclear weapons tests and uranium enrichment and allow international inspectors to monitor activities at its main nuclear complex. The surprise announcement raised the possibility of ending a diplomatic impasse that has allowed the country’s nuclear program to continue for years without international oversight.

The Obama administration called the steps “important, if limited.”

But the announcement seemed to signal that North Korea’s new leader, Kim Jong-un, is at least willing to consider a return to negotiations and to engage with the United States, which pledged in exchange to ship tons of food aid to the isolated, impoverished nation.
Los Angeles Times

North Korea: What does 240,000 metric tons of food mean?

February 29, 2012 | 1:20 pm

Hunger is a known menace in North Korea: In most of the country, even a bowl of rice is a rare treat. North Korea and the U.S. are poised to strike a deal that would bring 240,000 metric tons of food aid to the impoverished country if it suspends nuclear weapons tests and enrichment.

What would all that food really mean for North Korea? Here’s a quick look.

Experts Stephan Haggard and Marcus Noland have estimated that North Korea has been falling below the minimum grain supplies needed for everyone to have enough food, as the graph below shows.

The yellow line represents their estimates; the blue line is U.N. estimates, which are somewhat lower. The Times added a green arrow to show how much the minimum needed to avoid starvation.

Famine in North Korea 1995 – 1998
unknown number of victims
estimates 600,000 – 3,000,000
in a population of 23 million

Impact of Food Aid

Minimum Cereals Requirement Surplus/Deficit

1995 2012

impact of food aid

Minimum needed to avoid starvation
Recent situation (see the assigned reading written by Hecker) —

- 2010 November: NK showed visiting U.S. experts (Carlin, Hecker, and Lewis)
  - An openly constructed, recently completed small but industrial-scale centrifuge uranium-enrichment facility
  - An experimental light-water reactor (LWR) under construction
- NK claimed 2,000 P-2 centrifuges in 6 cascades in the modern facility at Yongbyon (build with external help from Khan)
- Publicly displayed facility is sufficient to produce
  - 2 tons of LEU/year, enough to supply the LWR under construction
  - 1 bomb/year of HEU, if slightly reconfigured
- Experts believe NK has undisclosed centrifuge facilities at other sites, probably producing weapon-grade HEU. NK has fundamentally changed its nuclear strategy.
- New leadership under Kim Jong-un appears to continue nuclear weapons program aggressively.
North Korea’s Nuclear Program – 12

• NK’s new nuclear strategy —
  — Appears to have abandoned its Pu program, shutting down its 5 MWe gas-graphite reactor and giving up on external assistance for LWRs
  — Is attempting to construct an experimental 25-30 MWe LWR of indigenous design as part of an electrical power program (probably not for bomb Pu)

• Major concerns about NK’s new nuclear strategy —
  — Can NK construct its own LWR safely?
  — Will NK’s enrichment program lead to additional weapons or export?
Can NK construct its own LWR safely?

— NK appears to have no experience with key LWR design and safety issues.
— Radiation-resistant steels and stringent construction are needed to withstand the intense, long-term radiation produced by LWRs.
— NK has little experience with uranium oxide fuels and fuel-cladding alloys.
— The concrete reactor foundation is insufficiently robust.
— The concrete containment shell is being poured in small sections from a small concrete mixer.
— These safety concerns will increase dramatically if NK builds larger LWRs, because the risks would extend well beyond NK’s borders.
North Korea’s Nuclear Program – 14

• Will NK’s enrichment program lead to additional weapons or export?
  — Bomb-grade HEU can be produced by slightly reconfiguring the existing centrifuge cascade
  — NK has indigenous U ore and all the know-how and equipment needed to make feedstock for its centrifuge cascades

• NK can ratchet up the current nuclear threat by
  — Greatly expanding its HEU production at undisclosed sites
  — Increasing substantially the size of its nuclear arsenal
  — Conducting additional nuclear tests to increase the sophistication of its nuclear weapon designs
  — Exporting nuclear weapon materials or technology

• NK’s categorical denial of any earlier enrichment activities, when they clearly existed, complicates diplomatic reengagement
What to Do About NK’s Nuclear Program?

• Top priority: prevent NK from expanding its arsenal or exporting its nuclear technologies
• Long-term goal: denuclearize the Korean peninsula
• Few options but to reengage NK diplomatically
• Hecker advocates 3 No’s supported by 1 Yes:
  — No more bombs
  — No better bombs (which means no more testing)
  — No export of bombs or bomb technology and materials
  — Yes to meeting NK’s fundamental security concerns
• What are NK’s fundamental security requirements?
  — Normalization of relations with the United States
  — Energy and economic aid / Regime survival
