

A glimpse of computational methods in biological physics:
Case study on three proteins and a cellular organelle

KlausSchulten

Theoretical and Computational Biophysics Group
February 15, 2012

Administrative issues

- Assignment from this lecture: read the case study on ubiquitin and choose **FOUR** out of the six exercises to complete: <http://www.ks.uiuc.edu/Training/CaseStudies/index.html#ubqcs>
- You will have to download and install the software VMD: <http://www.ks.uiuc.edu/Research/vmd/>
- For any questions and assistance on the assignment, email Ivan Teo at teo7@illinois.edu
- Assignments should be given to Professor Selvin before class on February 22, 2012 (next Wednesday).

Case Study: Ubiquitin

Eduardo Cruz-Chu and JC Gambart

1 Introduction

Without a doubt, the most organized and coordinated machine known is the biological cell. Inside its micrometer-scale diameter, a wide variety of macromolecules (DNA, proteins, sugars, lipids, etc.) work together in a cooperative way, balancing energy and matter to keep the cell alive. Within the cell, proteins are the overachievers. They allow the movement of water and ions through the cell membrane, help ATP to store energy, assist DNA during replication, recognize foreign infections, and more. However, all of these functions don't work independently of each other. To maintain harmony and efficiency between various functions, most processes have to be turned on or off according to different cellular stages and changes within the environment.

To this end, together with the mechanisms to assemble functional proteins and to turn on their functions, there should be counterparts to suppress and disassemble proteins when they are no longer needed. The cellular machine depends on assembly and disassembly to regulate the effective concentration of proteins and their corresponding activities [1]. Furthermore, defective

Amino Acid	SLC	DNA codons
Isoleucine	I	ATT, ATC, ATA
Leucine	L	CTT, CTC, CTA, CTG, TTA, TTG
Valine	V	GTT, GTC, GTA, GTG
Phenylalanine	F	TTT, TTC
Methionine	M	ATG
Cysteine	C	TGT, TGC
Alanine	A	GCT, GCC, GCA, GCG
Glycine	G	GGT, GGC, GGA, GGG
Proline	P	CCT, CCC, CCA, CCG
Threonine	T	ACT, ACC, ACA, ACG
Serine	S	TCT, TCC, TCA, TCG, AGT, AGC
Tyrosine	Y	TAT, TAC
Tryptophan	W	TGG
Glutamine	Q	CAA, CAG
Asparagine	N	AAT, AAC
Histidine	H	CAT, CAC
Glutamic acid	E	GAA, GAG
Aspartic acid	D	GAT, GAC
Lysine	K	AAA, AAG
Arginine	R	CGT, CGC, CGA, CGG, AGA, AGG
Stop codons	Stop	TAA, TAG, TGA

Ubiquitin

Quick Overview of Protein Structure

What Proteins are Made of: Primary Structure (Sequence) of Amino Acids

Proteins: polymeric molecules linking amino acids through peptide bonds

Peptide bond linking two amino acids

Looking at Proteins Through the Program VMD

Learn to use VMD from the
“Using VMD” tutorial available at
<http://www.ks.uiuc.edu/Training/Tutorials/>

VMD for Mac OS X, Unix, and
Windows is available for download at
<http://www.ks.uiuc.edu/Research/vmd/>

Using VMD

VMD Developer:
John Stone

Tutorial Contributors:

Alek Aksimentiev, Anton Arkhipov, Robert Brunner, Jordi Cohen, Brijet Dhaliwal, John Eargle, Jen Hsin, Fatemeh Khalili, Eric H. Lee, Zan Luthey-Schulten, Patrick O'Donoghue, Elijah Roberts, Anurag Sethi, Marcos Sotomayor, Emad Tajkhorshid, Leonardo Trabuco, Elizabeth Villa, Yi Wang, David Wells, Dan Wright, Ying Yin

Protein Secondary Structure

An antiparallel beta sheet

Beta sheets are created, when atoms of beta strands are hydrogen bound. Beta-sheets may consist of parallel strands, antiparallel strands or out of a mixture of parallel and antiparallel strands.

An alpha helix

The backbone is formed as a helix. An ideal alpha helix consists of 3.6 residues per complete turn. The side chains stick out. There are hydrogen bonds between the carboxy group of amino acid and the amino group of another amino acid $n+4$. The mean phi angle is -62 degrees and the mean psi angle is -41 degrees

Tertiary and Quarternary Structures of Proteins

Tertiary structure describes the packing of alpha-helices, beta-sheets and random coils with respect to each other on the level of one whole polypeptide chain.

Quaternary structure only exists, if there is more than one polypeptide chain present in a complex protein. Then quaternary structure describes the spatial organization of the chains

Focus on one protein

Ubiquitin

- 76 amino acids
- highly conserved
- covalently attaches to proteins and tags them for degradation
- other cell trafficking

Mono-ubiquitylation versus multi-ubiquitylation

Multifaceted. Ubiquitin can attach to its various substrate proteins, either singly or in chains, and that in turn might determine what effect the ubiquitination has. (K29, K48, and K63 refer to the particular lysine amino acid used to link the ubiquitins to each other.)
