Today we are going to look at techniques to revise and polish technical manuscripts.
Because we think in words, the act of expressing observation in language—of distilling amorphous thoughts into words—is a powerful tool for clarifying your thinking.

Translating your thoughts into words so that you can communicate them to someone else forces you
- to question your assumptions.
- to look for holes.
- to fill in gaps in your thinking.

“The act of composition disciplines the mind; writing is one way to go about thinking, and the practice and habit of writing not only drain the mind, but supply it too.” Strunk and White, The Elements of Style, 3rd ed., p. 70.

“It’s also through writing that we learn to articulate our thoughts clearly; our critical thinking is strengthened and clarified by our expression of it in writing.” J.L. Craig, “Writing strategies for graduate students,” Proc. ASEE Ann. Conf. & Exposition (Nashville, TN, ASEE, 2005).

Antoine Marie Jean-Baptiste Roger, comte de Saint Exupéry, Mort pour la France, was a French aristocrat, writer, poet, and pioneering aviator. He became a laureate of several of France’s highest literary awards and also won the U.S. National Book Award. He is best remembered for his novella The Little Prince (Le Petit Prince) and for his lyrical aviation writings, including Wind, Sand and Stars and Night Flight.
Effective editing incorporates four distinct elements

1. Clarifying the selection and presentation of ideas, tailored to the audience
2. Organizing the narrative logically
3. Using language precisely and concisely
4. Correcting “mechanical” errors that detract from a professional presentation
Think of the process as zooming in on the manuscript.

I have learned that you can talk and talk and talk to physicists, but if you really want to get their attention, show them an equation. Hence the Elliott editing equations given above.

In Eq. 1, $t$ is the time it actually takes to edit a manuscript, $h$ is the number of hours you think any idiot should be able to do it in, and $\varepsilon$ is not necessarily trivial.

Equation 2 is the expression for the time it takes to edit a paper that has multiple authors, where $t$ is the time it actually takes, $h$ is the number of hours you think it should take, $a$ is the number of authors, and $\varepsilon$, again, is not necessarily trivial.
1. Look at the science first (macroscopic scale)

Is the information valid, significant, timely, and complete?

Is the context clear? What is new and different? What have you contributed?

Is the information presented at a level appropriate for the audience and the purpose?

Is the narrative arranged in a logical, coherent structure?

Do figures, equations, and tables support, emphasize, and clarify the main points of your paper?

The first pass is from the macroscopic (section) level—look at the science.

* Are the main points clearly identifiable and given appropriate emphasis?

* Do figures and tables support and enhance the main points?

* Is the narrative coherent—is there a clearly defined progression from background to hypothesis to method to results to conclusions?

   **TIP:** Cut and paste the first sentence of each paragraph into a new document. Read it aloud. Does it adequately tell your story? Are there gaps or omissions?

   See http://people.physics.illinois.edu/Celia/Lectures/Paragraphs.pdf for tips on how to build effective paragraphs to incorporate an organic, logical structure in your writing.

* Have you supplied sufficient background so that the reader can understand the significance of your work? Have you provided appropriate context through adequate referencing of prior work?

* Have you made your case? Have you justified your assumptions, anticipated reader questions and objections, and supported your arguments?

* Is it clear what you have contributed?
Scientists and engineers tend to be highly skeptical about “miracles.”

Provide transitional statements to tie ideas together.
State assumptions and inferences explicitly and provide supporting detail.
Add authority to your arguments by citing previous work.
Arrange your narrative in a logical structure.
Provide logical transitions

One section ends with:
“... Improved sensitivity is important because amplifiers and signal processors are nonlinear and thus can mix signals that lie outside the desired band; the mixing generates signals with frequencies that appear as in-band noise.”

Begin the next section with:
“To achieve the improved filter performance, high-quality epitaxial films of YBCO have been...”

The logical connection between the two sections is made clear by repeating the idea of improving performance

If you’ve followed my outlining and paragraph-building advice (http://people.physics.illinois.edu/Celia/SciWriter_Advice.pdf), you’ll already have an organically organized, logical narrative line. Reinforce that underlying structure by using transitional statements to tie paragraphs and sections together.
Include summary statements

“Testing the physics of nuclear isomers”

Problem statement (first page):
“Research in the late 1990s indicated x rays could be
used to trigger the release of energy from \(^{178}\text{Hf}\) …
Some estimates suggested that, with accelerated
decay, 1 g of 100-percent isomeric \(^{178}\text{Hf}\) could release
more energy than the detonation of 200 kg of TNT.”

Summary statement (last page):
“These findings can allay DOE’s concern about
potential applications of the purported isomer energy
source. X-ray induced decay of the Hf isomer does not
present a new concern for national security. It also is
not a viable alternative as a stand-alone energy source.”

Provide summary statements at the end of each major section of the paper.

The old speaker’s rule is “Tell them what you’re going to tell them. Tell them. Tell
them what you told them.” That advice is just as valid for paper and reports. Take if
from a mother—telling somebody something important three times is not overkill.
Next, zoom in to the **mesoscopic** (intermediate) level—look at the **words**.

- Is the language clear and unambiguous?
- Have you defined all acronyms and technical jargon that may be unfamiliar to your audience?
- Have you used the simplest word to unambiguously convey your meaning?
Semantics and syntax control clear communication

“Semantics” is the meaning of words; you must have a vocabulary adequate to describe things precisely

The difference between the right word and the almost-right word is the difference between lightning and lightning bug.

—Mark Twain

Scale your use of jargon to the intended audience

Note that words have connotations (overtones of associated ideas or emotions) beyond their literal dictionary meanings, which also affect the appropriateness of word choice.
Example: dis·place·ment [disˈplāsmənt]
- $\Delta x = x_f - x_0$ (physicist)
- the volume moved by the stroke of a piston (mechanical engineer)
- a geological fault (seismologist)
- the volume of water displaced by a vessel floating in it (marine engineer)
- percolation (pharmacist)
- abnormality in the position or form of a leaf or organ (botanist)
- a defense mechanism in which an emotion is transferred to another, more acceptable object (psychologist)

Semantics—the indirect relation between words and meaning; note that words have different connotations in different contexts; e.g. “displacement”
“Syntax” is the way words are put together to form sentences

Sloppy syntax can lead to confusion:

“Two months later, in late January of 1957, Bob wrote down the wave function for the superconducting state on a New York subway train.”

Subway trains in New York are superconducting?

One way to avoid sloppy syntax is to write shorter sentences. We’ll see how and why in a minute...
Avoid “abstractitis”
“writing that is so abstruse that even the writer does not know what he or she is trying to say”—Sir Ernest Gowers, GCB

1. Clarify—replace jargon with accessible terminology; use simple subjects and direct action verbs; de-convolute syntax
2. Quantify—replace wimpy, qualitative adjectives with quantitative descriptors
3. Objectify—give concrete examples; use analogies

As defined by Ernest Gowers and quoted by Bryan Garner in Garner’s Modern American Usage, abstractitis is writing that is so abstruse that even the writer does not know what he or she is trying to say. Here’s a description of the phenomenon:

“The words ...danced before my eyes in a meaningless procession: cross-reference to cross-reference, exception upon exception—couched in abstract terms that offer no handle to seize hold of—leave in my mind only a confused sense of some vitally important, but successfully concealed, purport, which it is my duty to extract, but which is within my power, if at all, only after the most inordinate expenditure of time.” (Yale L.J. 167, 169 [1947]).

While Gowers in this case was talking about the U.S. Internal Revenue Code, he could easily have been describing many physics papers.

Gowers’ use of a 68-word sentence is a rant for another day.
Write shorter sentences—less than 25 words.

Avoid long strings of nouns used as adjectives—“mean field anisotropic superconducting reverse bias toroid magnet” (or MASRBTM, to its fans)

Follow the “three preposition” rule.* If you have a sentence that contains more than three prepositions, rewrite it before it wanders off to die.

Writing shorter paragraphs will also help your reader follow the logic of your narrative. For more information on how to write strong paragraphs, see http://people.physics.illinois.edu/Celia/Lectures/Paragraphs.pdf.

*With thanks to Stephanie Teich-McGoldrick, who first introduced me to the three-preposition rule.
Keep verbs close to their nouns

Several schemes ranging from minimal computational cost and poor accuracy to high computational cost and high accuracy can be employed.

One of the pitfalls of using the passive voice is the tendency by amateurs to maroon the verb at the end of the sentence. Avoid this practice.
Recast *negative expressions*—
a positive is easier to understand
and is usually more concise

Although some data supported the hypothesis, it
could not be concluded that output scaled linearly
with current.

*Output appeared to scale nonlinearly with current.*

Arcing under high-current operation could not be
avoided without the use of the insulated feedthrough.

*The insulated feedthrough prevented arcing,
even during high-current operation.*
Avoid beginning clauses with “There are...” or “It is...—put the subject first and plunge right in

“Aside from the point defect corresponding to the cone’s vertex, there is a ‘focal’ set consisting of the two parabolic segments $x^2 = b|y| + b^2/4$.”

“In addition to the point defect corresponding to the cone’s vertex, a ‘focal’ set is observed that consists of the two parabolic segments $x^2 = b|y| + b^2/4$."

Train yourself to spot “There is...” and “There are...” sentences and rewrite them in the passive voice, which puts the important point first in the sentence (“front loads”).
Ideal, a pronoun should refer to the noun immediately preceding it. Don’t make the reader go back several sentences to determine what “it” you mean. By the same token, you may not use a pronoun until you have first used the noun to which the pronoun refers.
Avoid the big A’s—amphibologies and anthropomorphism

Beware of words with multiple meanings
A sintered mixture for the experimental heating rod was prepared from martensitic steel and 5% nickel. *This element* proved to be unsatisfactory.
A subtle but important *point* about the series of *points* generated is that they are not statistically independent *points*.

Don’t give human traits to inanimate objects
The substrate *tells* the YBCO how to align during growth.
The dial *needs* to be set at …
Be sure to use the right word
Alternate or alternative?
Ability, capacity, capability?
Affect or effect?
Principle or principal?
Optimal or optimum?
Biannual or biennial?
Compliment or complement?

The linear relationship in the plots at $T \geq 1340$ K only agreed with experimental data when $t \leq 10$ ns.

“with”
We show that solitons undergo a strong blueshift in fibers with a dispersion landscape that varies along the direction of propagation.

“etc.”
It is well known that localized magnetic moments and the couplings between them are two indispensable factors to induce long-range spin ordering in solids, exhibiting ferromagnetism (FM), antiferromagnetism (AFM), ferrimagnetism, etc.

No more naked “this”es—just don’t

In some pellet designs, the average ionic charge, Z, and the laser intensity, I, are large enough that the distribution function is predicted to be non-Maxwellian (flat-topped). This has important consequences: reduction of the absorption rate, electron flux, and modification of the continuum x-ray emission rates.

A certain amount of energy is required to cause an electron to spin flip when it is beside another electron. Thus, the energy required is double this and is provided by the incident photons.

Change nouns ending in -tion, -ment, and -ance back into verbs

Many English words derived from Latin change verbs into the nominative form by adding –tion, –ment, and –ance suffixes to the verbs. Thus act (v.) becomes action (n.), arrange (v.) becomes arrangement (n.), and perform (v.) becomes performance.

An easy way to improve the conciseness and vigor of your writing is to be on the alert for these nouns and change them back into the verbs they came from.
3. Now for proofreading (microscopic scale)

Editing concentrates on ideas and expression

Proofing concentrates on mechanics

The importance of proofreading cannot be overstated
Proofreading examines the manuscript one word at a time

Acronyms, mathematical symbols, and special characters are defined at first usage

Format and typography are consistent and conform to manuscript preparation rules

Technical writing conventions are observed

Grammar and usage are flawless

Punctuation and spelling are *perfect*

**TIP 1:** Always proofread from a hard copy

**TIP 2:** Start at the bottom right-hand corner and read backwards and up
Maintain witless consistency throughout the text

Terminology—always call the same things by the same names
Typography—use of italics and boldface
Expression of numbers
Definitions of symbols or special characters
Legends in figures
Style of subheadings, captions, table titles
Use of color

If you talk for four pages about a “solar collector” and suddenly introduce a “solar absorber” on Page 5, a careful reader will wonder if something qualitatively different is being described.
Present a professional-looking document

Select an appropriate font and size
Use no more than two font styles
Automatically hyphenate the document to avoid annoying white spaces in fully justified lines
Position graphics strategically
Select an attractive page layout
  Adequate white space
  Clean, uncluttered appearance
To recap:

Focus on important ideas, logical structure, precise language, “mechanical errors” —in this order

Editing should proceed in three steps: content, style, proofreading

Pay attention to transitions and reader cues

Proofread from a hard copy

*Distill, distill, distill...*
