

Statics - TAM 211

Lecture 37

April 20, 2018

Chap 9.5

Announcements

□ Upcoming deadlines:

- Monday (4/23)
 - Mastering Engineering Tutorial 15
- Tuesday (4/24)
 - PL HW 14
- Quiz 6
 - CBTF (4/25-27)
- Written Assignment 6
 - **Wednesday May 2**

The Submarine Sports Car

Price \$2,000,000

Chapter 9 Part II – Fluid Pressure

Chap 9.5

Goal and objective

- Present a method for finding the resultant force of a pressure loading caused by a fluid

Mechanics is a branch of the physical sciences that is concerned with the **state of rest or motion of bodies that are subjected to the action of forces**

SOLIDS

TAM 210/211: Statics

Rigid Bodies

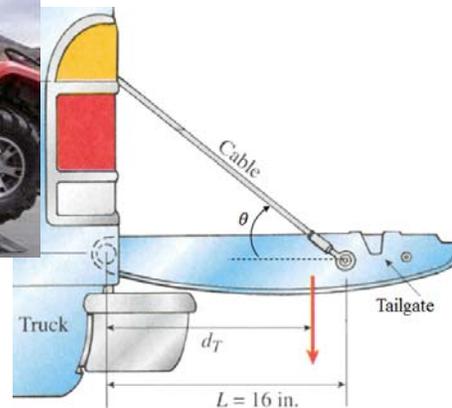

TAM212: Dynamics

Deformable Bodies

TAM 251: Solid Mechanics

FLUIDS

What Makes a Fluid or Solid?

Honey

Rock

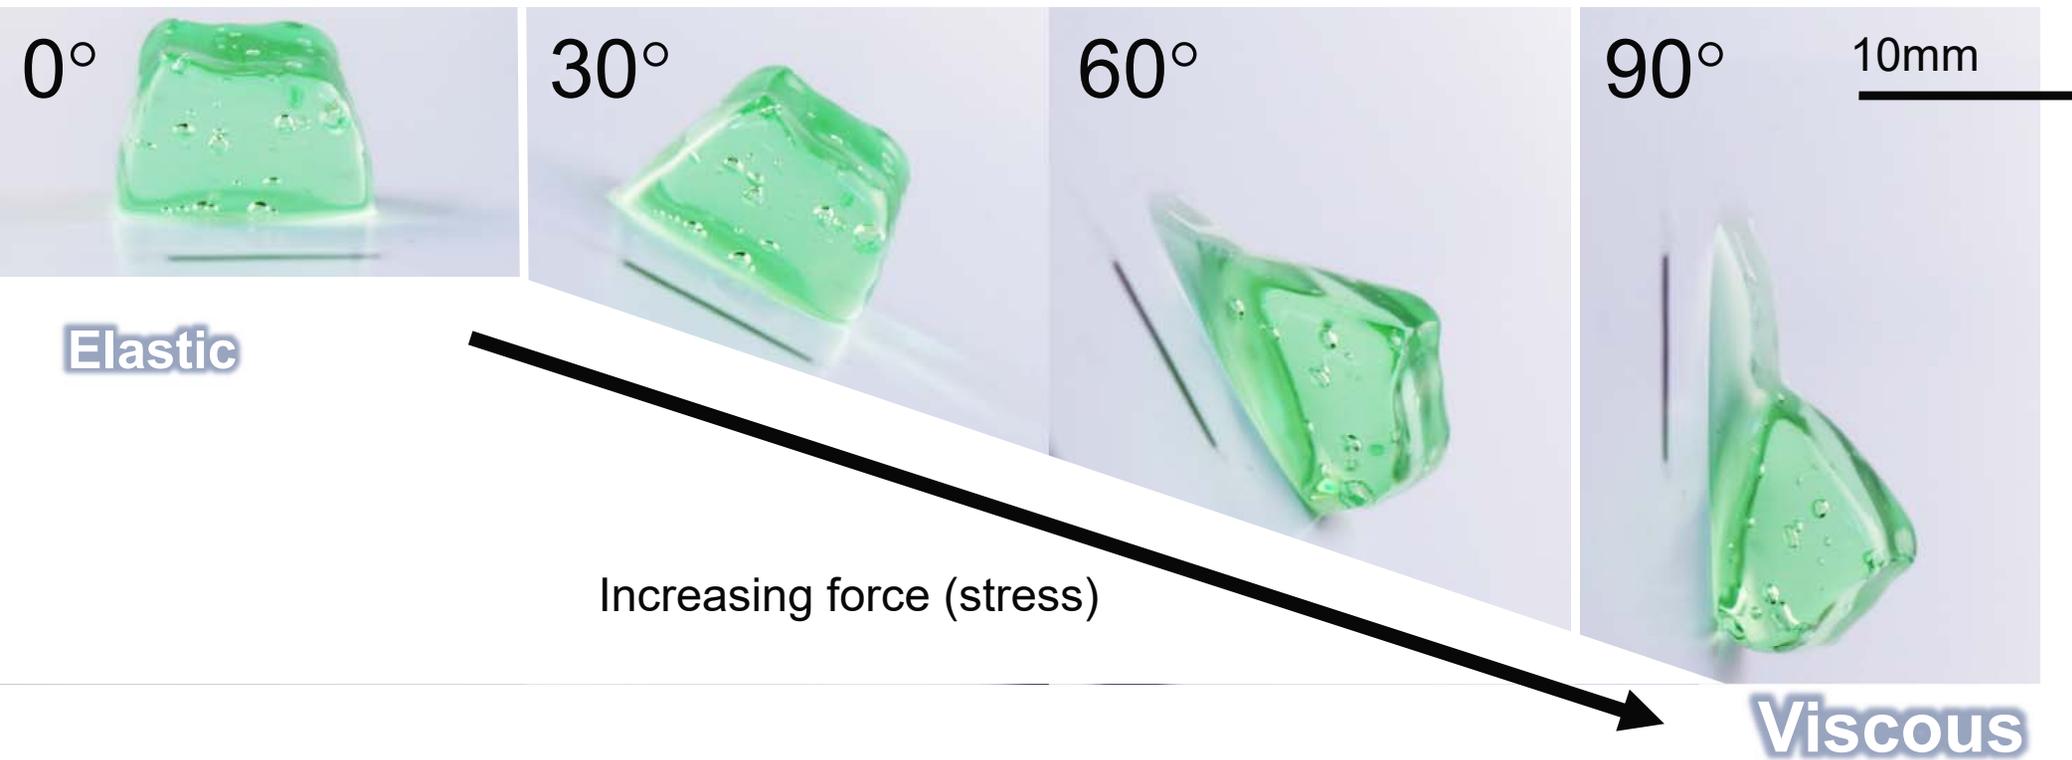

What is Sand?

Particles swollen with water – ‘Squishy Baff’

Aloe Gel

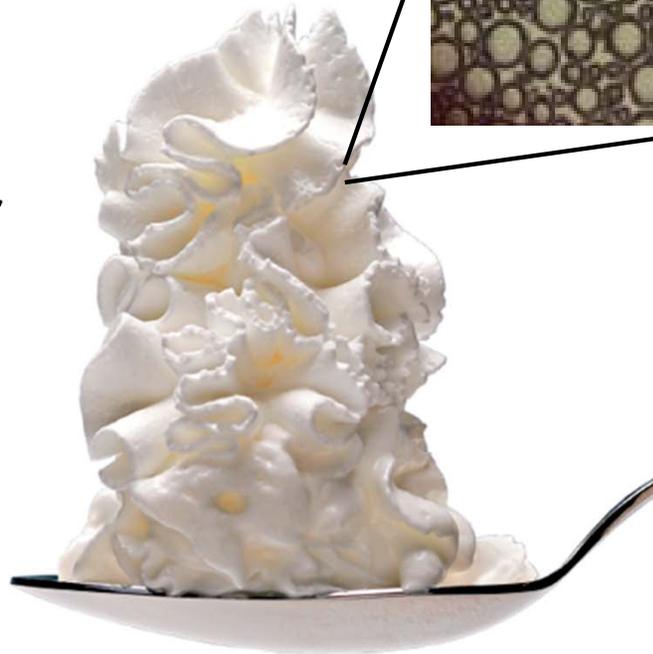

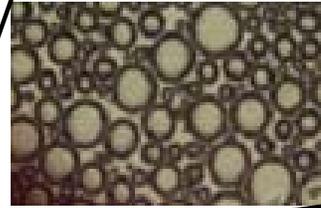

They act like a solid...

But they flow like a fluid once enough stress is applied.

Whipping cream (liquid) + air (gas) = Foam (solid)

with compressed air

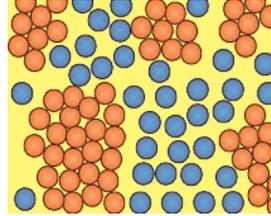

mechanical beating

They look like a fluid...

[Video](#)

cornstarch + water =

(small, hard particles)

But they may bear static loads like solids

Summary

Water takes shape of its container. Rock does not.

Water and rock fit classical definitions of fluid and solid, respectively

Sand and Squishy Baff take the shape of containers, but are composed of solid particles

Sand and Squishy Baff are granular materials, which have properties of both fluids and solid

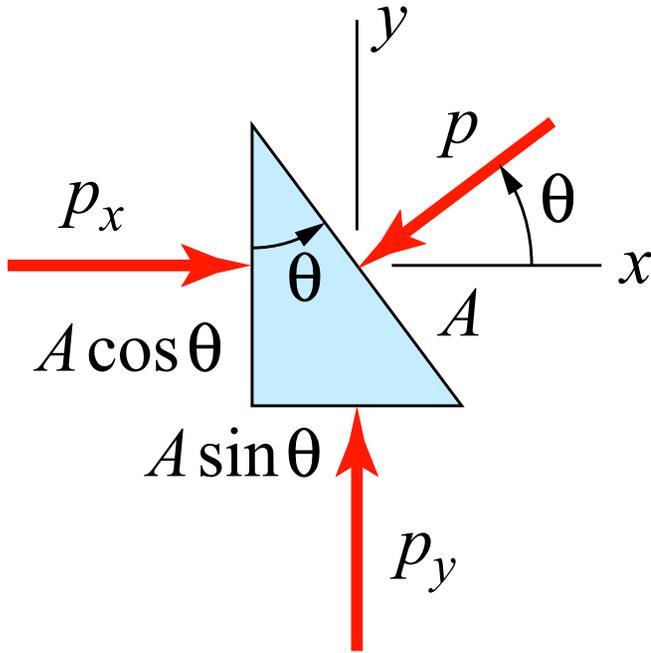

The aloe gel holds its shape and can trap air bubbles, until a certain amount of stress is applied.

Aloe gel is a suspension of particles, which is able to bear static load like a solid but behaves like a fluid when “enough” stress is applied.

Fluids

Pascal's law: A fluid at rest creates a pressure p at a point that is the *same* in *all* directions. Recall: $p = F/A$, or $F = pA$

For equilibrium of **an infinitesimal element**,

$$\Sigma F_x = 0: \quad p_x (A \cos \theta) - p A \cos \theta = 0 \quad \Rightarrow \quad p_x = p,$$

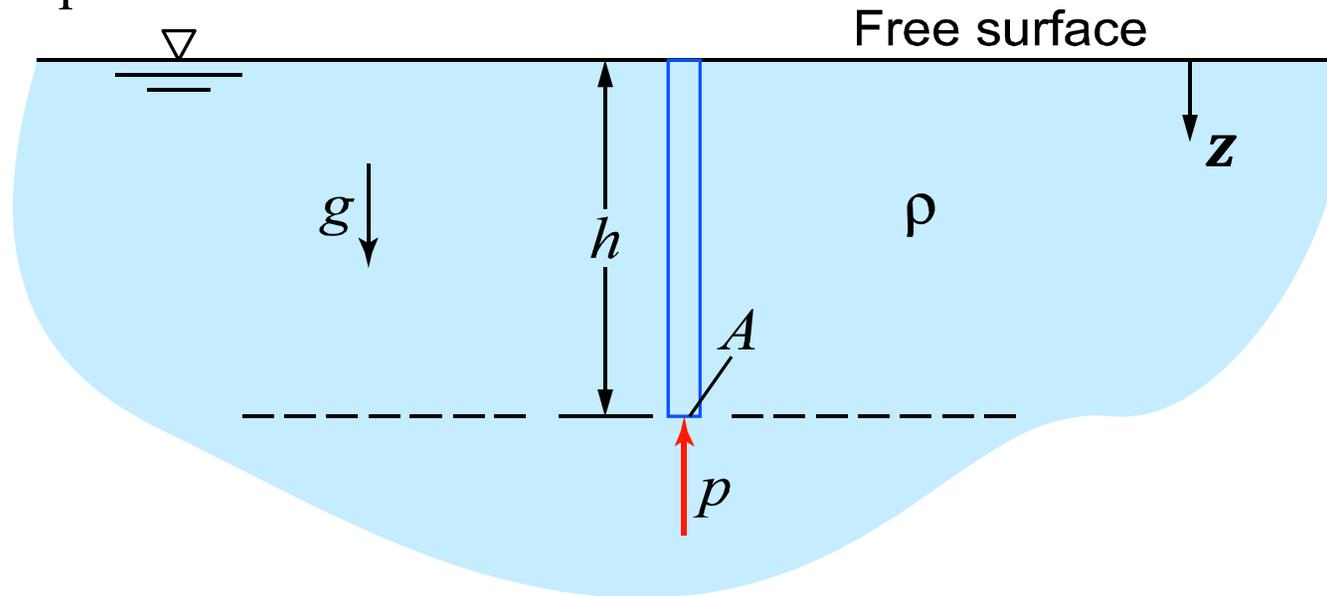

$$\Sigma F_y = 0: \quad p_y (A \sin \theta) - p A \sin \theta = 0 \quad \Rightarrow \quad p_y = p.$$

Thus, $p_x = p_y = p$ for any angle θ . The Pascal's law holds for fluids, but not solids.

Incompressible: An incompressible fluid is one for which the mass density ρ is independent of the pressure p . Liquids are generally considered incompressible. Gases are compressible, but may be approximated as incompressible if the pressure variations are relatively small.

Fluid Pressure

For an incompressible fluid at rest with mass density ρ , the pressure varies linearly with depth z

Summing forces in the vertical direction gives

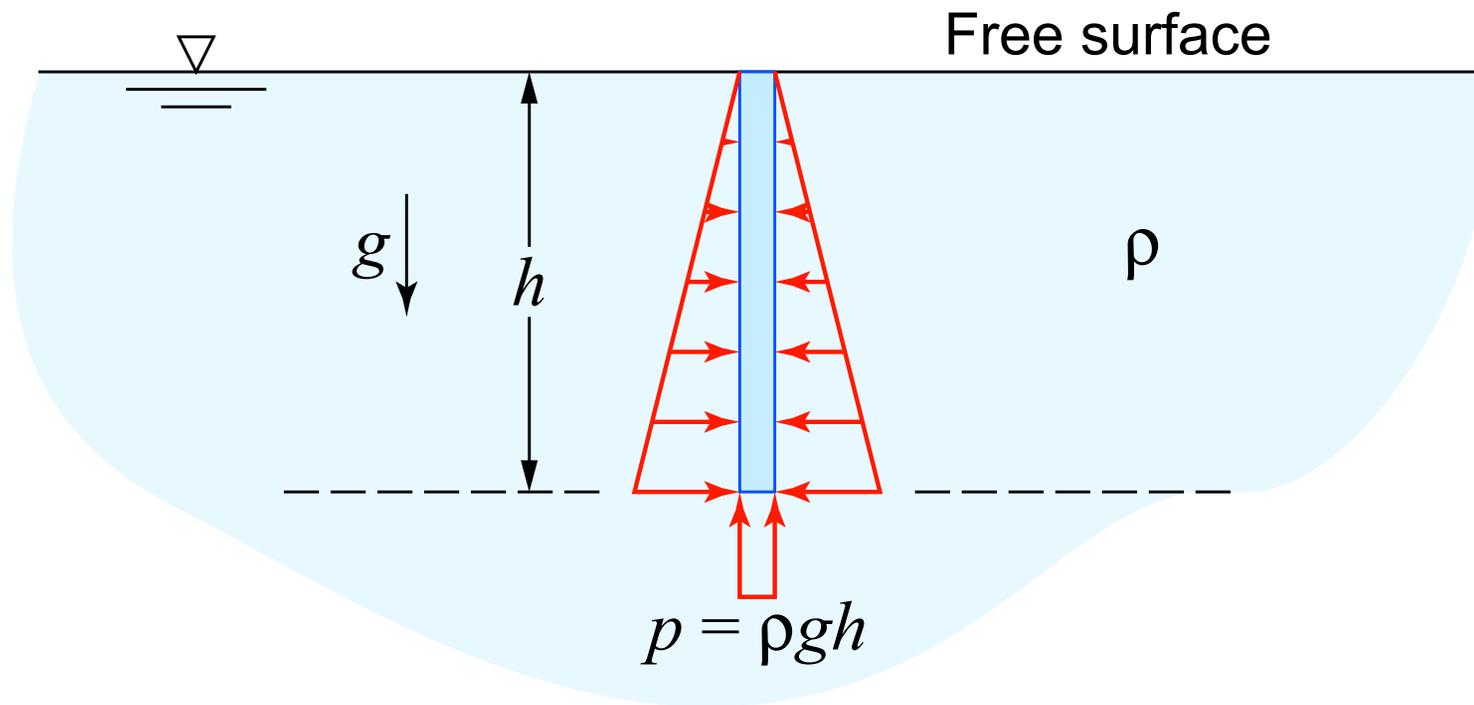

$$\sum F_z = 0: \quad mg - pA = 0 \quad \Rightarrow \quad (\rho(Ah))g - pA = 0 \quad \text{or} \quad p = \rho gh.$$

In general, this result is written as $p = \rho g z = \gamma z$

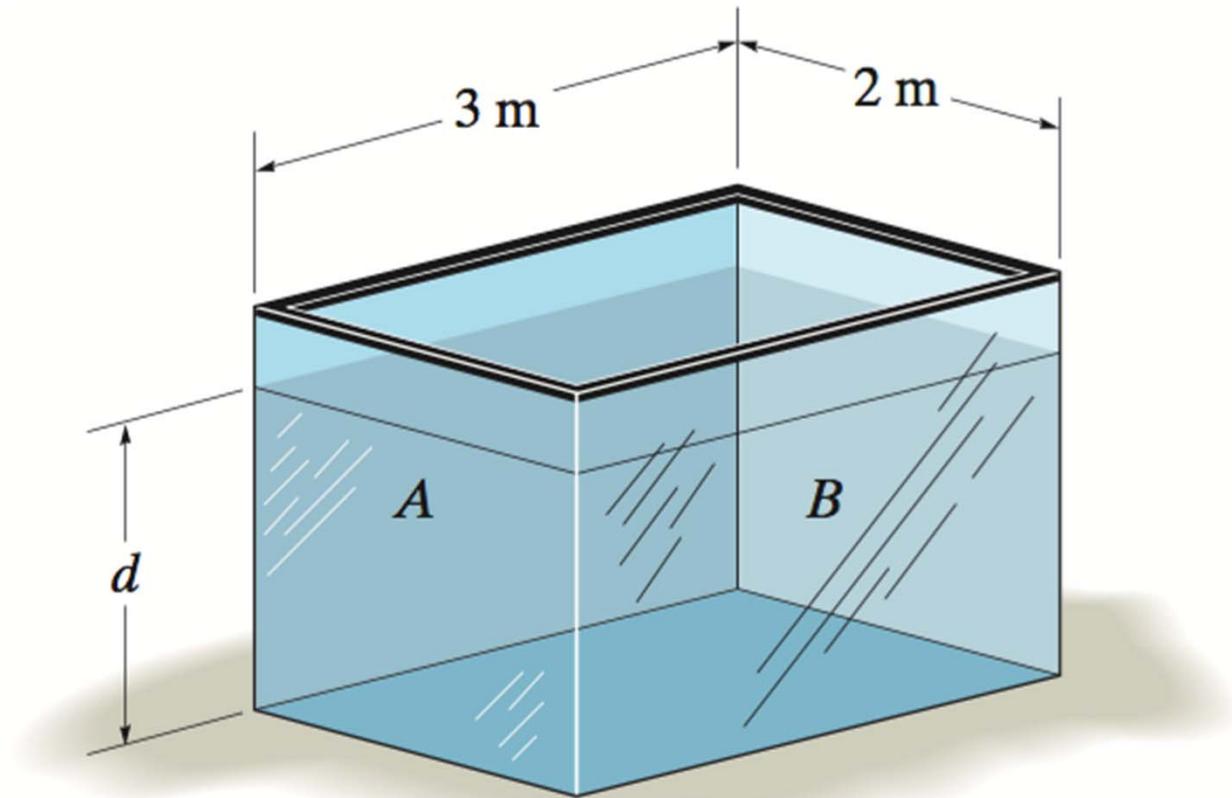

where $\gamma = \rho g$ is called the specific weight (weight per unit volume).

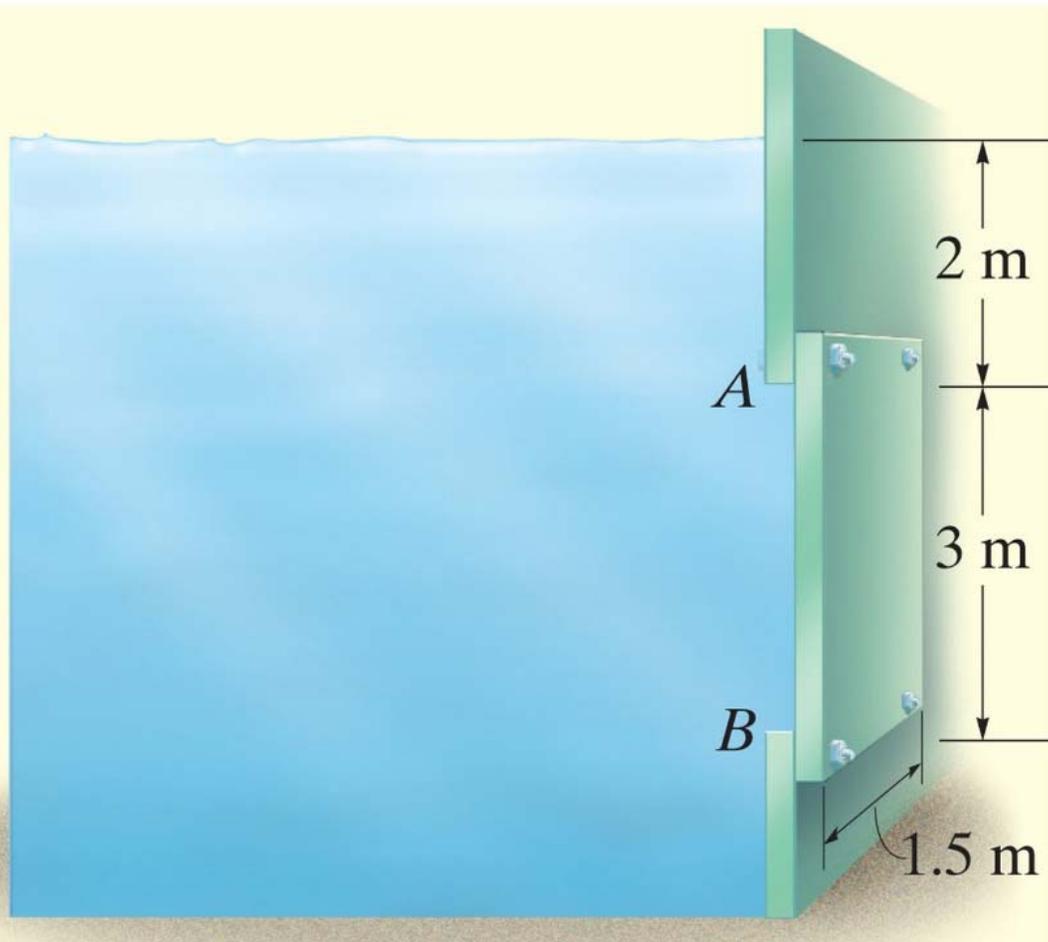

For fresh water: $\gamma = 62.4 \text{ lb/ft}^3$ (9810 N/m^3)

Observe that the pressure varies *linearly* from the free surface, and is *constant* along any horizontal plane (since h is constant):

The tank is filled with water to a depth of $d = 4$ m. Determine the resultant force the water exerts on side A of the tank. ($\rho = 1000$ kg/m³)

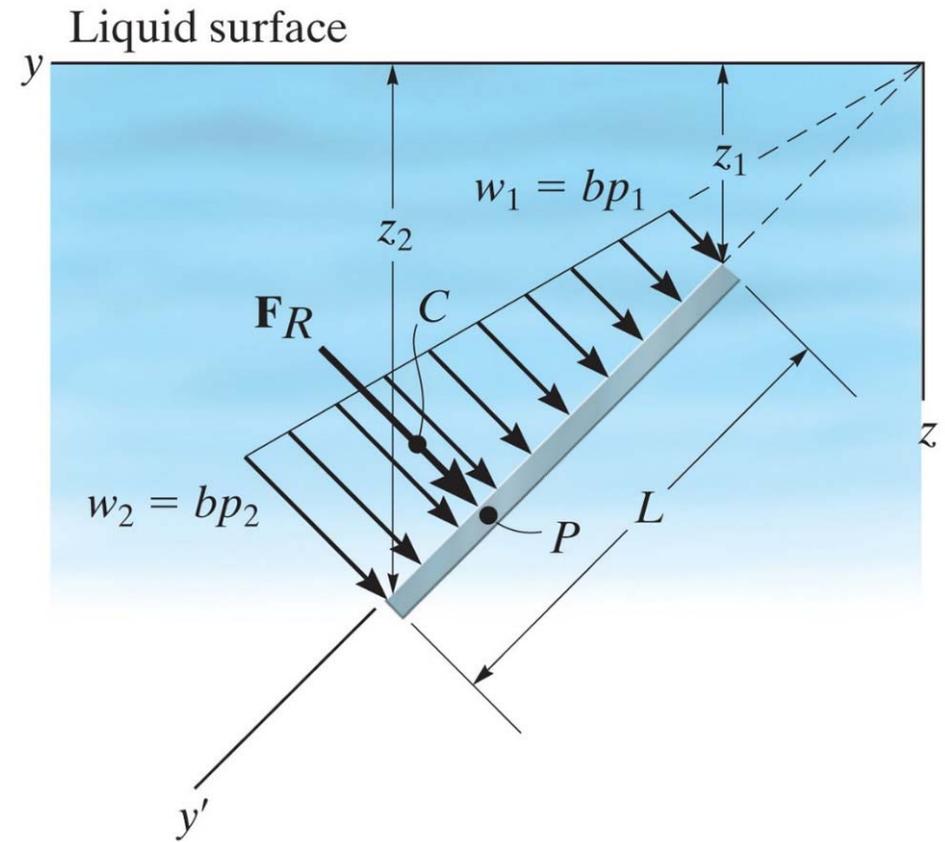

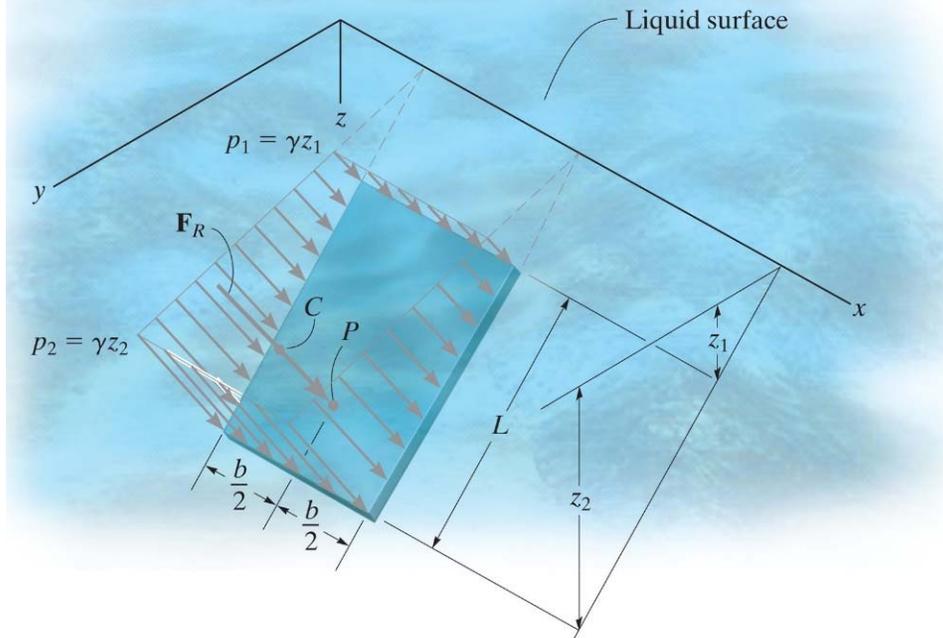

Determine the magnitude and location of the resultant hydrostatic force acting on the submerged rectangular plate AB . The plate has width 1.5m. The density of the water is 1000 kg/m^3

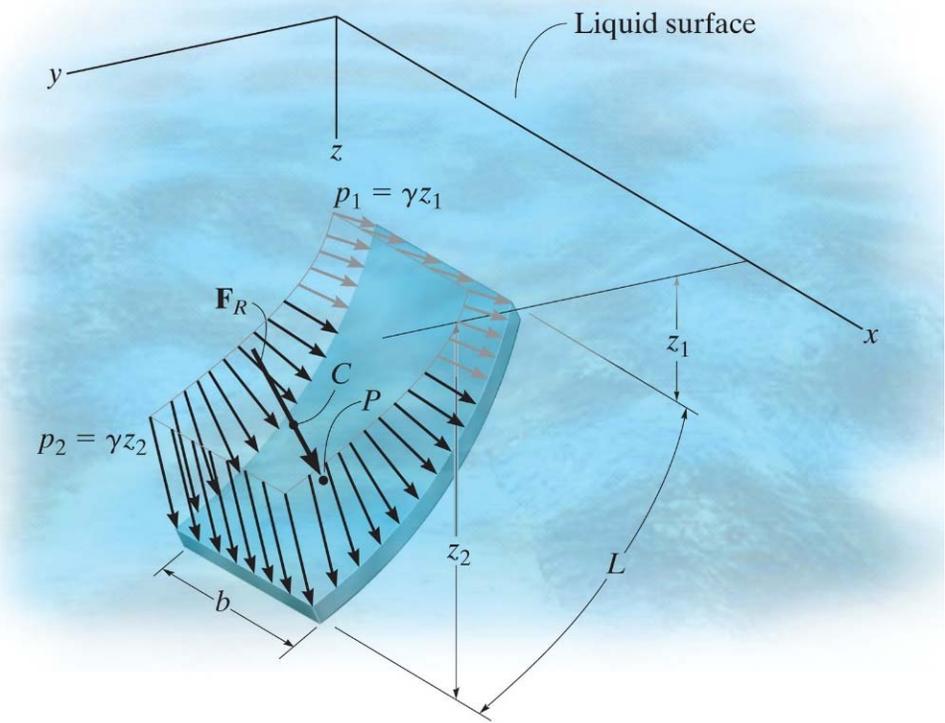

Fluid Pressure of a flat plate with constant width

For an incompressible fluid at rest with mass density γ , the pressure varies linearly with depth z

Fluid Pressure of a curved plate with constant width

For an incompressible fluid at rest with mass density γ , the pressure varies linearly with depth z

Liquid surface
